PDF Links and Forms

In this document we describe the support for Acrobat form elements in an [AcroTeX](#) document. The *PDF Reference* indicates there are four different categories of fields for a total of seven types of fields.

1. Button Fields

- (a) Push Button
- (b) Check Box
- (c) Radio Button

2. Choice Fields

- (a) List Box
- (b) Combo Box

3. Text Fields

4. Signature Fields

The [AcroTeX Bundle](#) now supports *signature fields*. Using the command `\sigField`, an unsigned signature field is created. The field can be signed, either by using Acrobat, or programmatically from a \LaTeX source, but you need to use `aeb_pro` and to create the PDF using Acrobat Distiller.

The `hyperref` Package (Rahtz, Oberdiek *et al*) provides support for the same set of form fields; however, not all features of these fields can be accessed through the `hyperref` commands. I was determined to write my own set of commands which would be sufficiently comprehensive and extendable to suit all the needs of the [AcroTeX Bundle](#). All the quiz environments have been modified to use this new set of form commands, in this way, there is a uniform treatment of all form fields in the [AcroTeX Bundle](#).

► The demo files for eForm support are `eqform.tex`, for those using the Acrobat Distiller to create a PDF document, and `eqform_pd.tex`, for those who use `pdftex` or `dvipdfm`.

Online Resources: The following online resources are recommended:

- [Core JavaScript Reference](#) at Mozilla Developer Center.
- [JavaScript for Acrobat API Reference](#) at the Acrobat Developer Center. In the navigation panel on the left, select JavaScript.
- [PDF Blog](#), by D. P. Story.
- [AeB Blog](#), by D. P. Story.

1. Package Requirement and Options

Prior to Exerquiz version 5.9, `eforms` was an integral part of Exerquiz. I've now separated the two, making `eforms` into a stand-alone package that is called by Exerquiz.

1.1. Package Requirements

The `eforms` package requires `hyperref` (a newer version) and `insdljs`, a package that is part of the [AcroTeX Bundle](#).

1.2. Package Options

The `eforms` package has the usual driver options:

```
dvipsone, dvips, pdftex, dvipdfm, dvipdfmx, xetex
```

The package also works correctly with the `luatex` executable. Informing the package what driver you are using is important, because each driver has its own code that needs to be used to create form fields. For `dvips`, you should use

```
\usepackage[dvips]{eforms}
```

The `eforms` package now does automatic detection of `pdftex` (including `luatex`) and `xetex`. If the `web` or `exerquiz` package is used, `eforms` will use the driver defined in these earlier included packages.

A minimal document is

```
\documentclass{article}
\usepackage{eforms} % <-- the driver is pdftex, luatex, or xetex
\begin{document}
  % Content containing form fields, such as...
  Don't \pushButton[\CA{Push Me}]{myButton}{}{12bp},
  I fall down easily.
\end{document}
```

The `eforms` package brings in the `hyperref` package and passes it the driver, so there is no need to specify `hyperref`, usually. If you wish to introduce `hyperref` yourself with specific options, place it before `eforms`.

If you use the `exerquiz` package, `exerquiz` brings in the `eforms` package and passes the driver to it.

1.3. The preview option

When the `preview` option is taken, a frame box is drawn around any form field created by `eforms`, making the position of the field visible in the DVI previewer or PDF viewer. Being able to view the position on a form element enables you to determine whether any additional adjustments are needed to the position of the field. *Turn off this option* when you build the final version of your PDF file.

This option was originally developed for those using a DVI previewer, it is also useful for those using PDF creators `pdflatex`, `xelatex`, or `luatex`. Modern \LaTeX users employ quicker PDF viewers such as `sumatraPDF` or `PDF-Exchange`; these PDF viewers do not create form appearances as Adobe Reader and Acrobat do; consequently, an outline of the positions of the fields is most welcome.

`\ifpreview` The `preview` option just sets a switch (`\ifpreview`), which can conveniently be

`\previewOn` turned off and on using the commands `\previewOn` and `\previewOff` within the document itself. Related to `\previewOn` and `\previewOff` is the command `\pmpvOn` (poor man’s preview), covered in the next paragraph.

`\pmpvOn` **Poor man’s preview.** The `\pushButton` command of `eforms` produces a push button;¹ a common key to use is the `\CA` key, the value of which captions the button. As a companion to `\previewOn`, `eforms` defines `\pmpvOn` and `\pmpvOff`; when `\previewOn` is in effect, expanding `\pmpvOn` causes the value of the `\CA` key to be typeset into the pushbutton preview; for example,

```
\pushButton[\CA{Push Me}]{pbDemo}{}{13bp} Push Me
```

The button on the left is the normal appearance of the push button after Reader/Acrobat has supplied its appearance, the “button” on the right is how the button would appear in `sumatraPDF`, for example, just after PDF creation using `pdflatex`, `xelatex`, or `lualatex`, or in a DVI previewer after `latexing`.

There are ‘poor man’s previews’ for other fields that support a `\V` or `\CA` key (push buttons, text fields, list boxes, combo boxes, check boxes and radio button fields). In each case, the argument of the key is *typeset into the document* beneath the field when `\pmpvOn` is expanded prior. The arguments of `\V` and `\CA` recognize a local command `\tops` (`\textorpdfstring`) to offer an alternate string that is typeset:

`\tops`

preview value

```
\textField[\V{\tops{preview value}}{display value}]
  \DV{real value}]{topstxt}{1.5in}{13bp}
```

The field on the left shows how the text field actually appears within Adobe Reader, and the rectangle on the right is how that same field appears in a non-conforming PDF reader, such as `sumatraPDF`. The alias `\tops` should only be used within the `\V` and `\CA` keys.

For check box and radio button fields, the `\tops` command is not supported within the `\V` key. For these types of fields, the value key is typically a mark: a check, an cross, a star, and so on. The `eforms` package defines the declarative command `\pmpvMrk{<mrk>}` that takes one argument `<mrk>`, the (preview) mark to be used. The package declares `\pmpvMrk{X}`, another good choice is `\pmpvMrk{\checkmark$}`.

In the modern era of \LaTeX , it is customary by some to use `sumatraPDF` or some other PDF viewer during development; however, you should always open your final PDF (which was built with `\previewOff\pmpvOff`) in Adobe Reader DC (or in Acrobat), save it to obtain the correct appearances of the fields placed in the document.

1.4. The `useui` option

The `useui` option includes the `xkeyval` package, and defines a number of key-value pairs that are used in the optional arguments of the form fields and links. These key-value pairs are more “user-friendly” to use. See [Section 6](#), page 32, for a description of these key-value pairs.

¹Push buttons are covered in [Section 2.1](#), beginning on page 8.

1.5. The unicode option of hyperref

The `eforms` package will obey the `unicode` option of `hyperref`. Whenever this option is taken in `hyperref`, for certain keys (namely, `\V`, `\DV`, `\TU`, `\CA`, `\RC`, and `\AC`), standard latex markup may be used to enter the values of these keys, for example, in a text field, you might set `\V{J}\{u}rgen`. This key-value pair will produce a field value of “Jürgen” in that text field.

2. Form Fields

The `eforms` support for eForm defines seven basic (and internal) commands for creating the seven types of form elements. These seven are used as “building blocks” for defining all buttons, check boxes, radio buttons and text fields used in the `exerquiz` quizzes; and for defining seven user-commands: `\listBox`, `\comboBox`, `\pushButton`, `\checkBox`, `\radioButton`, `\textField`, and `\sigField`. These user commands are the topic of the subsequent sections.

Each of the above listed field commands has an optional first parameter that is used to modify the appearance of the field, and/or to add actions to the field. This is a “local” capability, i.e., a way of modifying an individual field. There is also a “global” mechanism. Each field type has its own `\every<FieldName>` command. For example, all buttons created by `\pushButton` can be modified using the `\everyPushButton` command. See the sections on [Check Boxes](#) and [Radio Buttons](#) for examples and additional comments.

► The local modifications (the ones inserted into the field by the first parameter) are read *after* the global modifications, in this way, the local modifications overwrite the global ones.

Key-value Pairs. The optional first parameter of each of the form and link commands take two styles of key-values:

1. `eforms` KVP: This is the key-value system originally developed, each KVP has the form `\<key>\{val}`. Through these keys, you can set the appearance of a form or link, and set the actions as well.

The `\presets` key is useful for developing collections of pre-defined key-value pairs for insertion into the optional parameter list. For example,

```
\def\myFavFive{%
  \BC{1 0 0}\BG{0 1 0}\textColor{1 0 0}\Q{2}\CA{Push Me}}
```

Later, a button can be created using these preset values:

```
\pushButton[\presets{\myFavFive}
  \A{\JS{app.alert("AcroTeX rocks!")}}]{pb1}{11bp}
```

The `eforms` KVP system is explained throughout the manual, a complete listing of all supported KVPs is found in the [Appendices](#), page 58.

2. `xkeyval` KVP: When the `useui` option is taken, key-value pairs are defined of the form $\langle key \rangle [= \langle value \rangle]$. The key-value pairs are actually a value of a special `eforms` key, `\ui`. The value of `\ui` consists of a comma-delimited list of `xkeyval` key-value pairs.

This style of key-value pairs also has a `presets` key, useful for developing collections of pre-defined key-value pairs for insertion into the optional parameter list. For example,

```
\def\myFavFive{%
  bordercolor={1 0 0},bgcolor={0 1 0},
  textcolor={1 0 0},align={right},uptxt={Push Me}}
```

Later, a button can be created using these preset values:

```
\pushButton[\ui{presets=\myFavFive,
  js={app.alert("AcroTeX rocks!")}}]{pb1}}{11bp}
```

The `xkeyval` KVP system is described in ‘[The `useui` option: A User-Friendly Interface](#)’ on page 32.

- The first (optional) parameter is read in first, but only after “sanitizing” certain characters that have special meaning to \LaTeX , these are `~`, `#`, and `&`; each of these may appear as part of a URL, or may appear in JavaScript code. Within the first parameter, these three character can be used freely, without escaping them.

2.1. Button Fields

Buttons are form elements that the user interacts with using only a mouse. There are three types of buttons: push buttons, check boxes and radio buttons.

• Push Buttons

The push button is a button field that has no value, it is neither on nor off. Generally, push buttons are used to initiate some action, such as JavaScript action.

```
\pushButton[#1]{#2}{#3}{#4}
```

Parameter Description:

#1: optional, used to enter any modification of appearance/actions

#2: the title of the button field

#3: the width of the bounding rectangle

#4: the height of the bounding rectangle

Default Appearance: The default appearance of a push button is determined by the following:

```
\W{1}\S{B}\F{\FPrint}\BC{0 0 0}
\H{P}\BG{.7529 .7529 .7529}
```

Key Variables: The first (optional) parameter can be used to modify the default appearance of a button field and to add some actions. Following is a list of the variables used within the brackets of this optional argument for the `pushbutton`: `\Ff`, `\F`, `\H`, `\TU`, `\W`, `\S`, `\R`, `\BC`, `\BG`, `\CA`, `\RC`, `\AC`, `\mkIns`, `\textFont`, `\textSize`, `\textColor`, `\A`, `\AA` and `\rawPDF`. See the [Support Key Variables](#) table for descriptions and notes on each of these variables.

- If the *width* argument (#3) is left empty, the \LaTeX code attempts to determine the appropriate width based on the width of the text given by `\CA`, `\RC` and `\AC`. See **Example 2**, below.

Global Modification: `\everyPushButton{<KV-pairs>}`

Example 1. This example resets all forms in this document:

```
\pushbutton[\CA{Push}\AC{Me}\RC{Reset}\A{/S/ResetForm}]
  {myButton}{36bp}{12bp}
```

Example 2. Button with empty *width* argument:

```
\pushbutton[\CA{Push}\AC{Me}\RC{Reset}\A{/S/ResetForm}]
  {myButton}{}{12bp}
```

Refer to the `icon-app` package to supply icon appearances to push buttons created by the `eforms` package.

• Check Boxes

A check box is a type of button that has one of two values, “off” or “on”. The value of the field when the field is “off” is `Off`; the value of the “on” state can be defined by the user.

```
\checkbox[#1]{#2}{#3}{#4}{#5}
```

Parameter Description:

- #1: optional, used to enter any modification of appearance/actions
- #2: the title of the check box button
- #3: the width of the bounding rectangle
- #4: the height of the bounding rectangle
- #5: the name of the “on” state (the export value)

Default Appearance: The default appearance of a standard check box is determined by the following:

```
\W{1}\S{S}\BC{0 0 0}\F{\FPrint}
```

Key Variables: The first (optional) parameter can be used to modify the default appearance of a check box and to add some actions. Following is a list of the variables used within the brackets of this optional argument for the check box: `\Ff`, `\F`, `\TU`, `\W`, `\S`, `\MK`, `\DA`, `\AP`, `\AS`, `\R`, `\textFont`, `\textSize`, `\textColor`, `\DV`, `\V`, `\A`, `\AA` and `\rawPDF`. See the [Supported Key Variables](#) table for descriptions and notes on each of these variables.

Global Modification: `\everyCheckBox{<KV-pairs>}`

Example 3. Are you married? Yes:

```
\checkBox[\symbolchoice{circle}]{myCheck}{10bp}{10bp}{On}
```

In the example, the appearance of this check box was modified through the global modification scheme. The following command appears in the preamble of this document:

```
\everyCheckBox{
  \BC{.690 .769 .871}      % border color
  \BG{.941 1 .941}        % background color
  \textColor{1 0 0}      % text color
}
```

Refer to the icon-appr package to supply icon appearances to checkbox buttons created by the eforms package.

• Radio Buttons

A radio button field is similar to a check box, but is meant to be used in unison with one or more additional radio buttons.

```
\radioButton[#1]{#2}{#3}{#4}{#5}
```

Parameter Description:

#1: optional, used to enter any modification of appearance/actions

#2: the title of the radio button

#3: the width of the bounding rectangle

#4: the height of the bounding rectangle

#5: the name of the “on” state (the export value)

▶ A collection of radio buttons meant to be used in unison need to all have the same title (parameter #2) but different export values (parameter #5).

Default Appearance: The default appearance of a standard radio button is determined by the following:

```
\W{1}\S{S}\BC{0 0 0}\F{\FPrint}
```

Key Variables: The first (optional) parameter can be used to modify the default appearance of a radio button and to add some actions. Following is a list of the variables used within the brackets of this optional argument for the radio button: `\Ff`, `\F`, `\TU`, `\W`, `\S`, `\MK`, `\DA`, `\AP`, `\AS`, `\R`, `\textFont`, `\textSize`, `\textColor`, `\DV`, `\V`, `\A`, `\AA` and `\rawPDF`. See the [Supported Key Variables](#) table for descriptions and notes on each of these variables.

Global Modification: `\everyRadioButton{(KV-pairs)}`

Example 4. What is your gender? Male: Female: Neither:

```
Male: \radioButton{myRadio}{10bp}{10bp}{Male}
Female: \radioButton{myRadio}{10bp}{10bp}{Female}
Neither: \radioButton[\A{\JS{app.alert("You can't be 'neither'!
I'm resetting the field, guess again!");\r
this.resetForm(["myRadio"])}}]{myRadio}{10bp}{10bp}{Neither}
```

In the example, the appearance of these radio button fields was modified through the global modification scheme. The following command appears in the preamble of this document:

```
\everyRadioButton{
  \BC{.690 .769 .871}      % border color
  \BG{.941 1 .941}        % background color
  \textColor{0 0 1}       % text color
  \symbolchoice{star}     % check symbol
}
```

Refer to the icon-appr package to supply icon appearances to radio button fields created by the eforms package.

2.2. Choice Fields

A choice field is a list of text items, one or more of which can be selected by the user.

• List Boxes

A scrollable list box is a type of choice field in which several of the choices are visible in a rectangle. A scroll bar becomes available if any of the items in the list are not visible in the rectangle provided.

```
\listBox[#1]{#2}{#3}{#4}{#5}
```

Parameter Description:

#1: optional, used to enter any modification of appearance/actions

#2: the title of the list box

#3: the width of the bounding rectangle

#4: the height of the bounding rectangle

#5: an array of appearance/values of list.

The fifth parameter needs more explanation. The value of this parameter which defines the items in the list—their appearance text and their export values—take two forms:

1. An array of arrays:

```
[(v1)(item1)][(v2)(item2)]...[(vn)(itemn)]
```

The first entry in the two member array is the export value of the item, the second is the appearance text of that item.

2. An array of strings:

```
(item1)(item2)...(itemn)
```

In this case, the export value is the same as the appearance text.

Default Appearance: The default appearance of a standard list box is determined by the following:

```
\W{1}\S{I}\F{\FPrint}\BC{0 0 0}
```

Key Variables: The first (optional) parameter can be used to modify the default appearance of a list and to add some actions. Following is a list of the variables used within the brackets of this optional argument for the list box: `\Ff`, `\F`, `\TU`, `\W`, `\S`, `\R`, `\BC`, `\BG`, `\mkIns`, `\textFont`, `\textSize`, `\textColor`, `\DV`, `\V`, `\A` and `\AA`. See the [Supported Key Variables](#) table for descriptions and notes on each of these variables.

► **\Ff Field flags.** Values appropriate to a list box are `\FfCommitOnSelChange` (commits immediately after selection, PDF 1.5); `\FfSort` (sorts² the items); `\FfMultiSelect` (allows more than one value to be selected, PDF 1.4). It is important to note that the flags `\FfMultiSelect` and `\FfCommitOnSelChange` cannot both be in effect. See the [Appendix](#) for a complete list of values for the `Ff` flag.

Global Modification: `\everyListBox{<KV-pairs>}`

Example 5. List Box (Version 5.0 Required):

```
\listBox[\autoCenter{n}\DV{1}\V{1}
  \BG{0.98 0.92 0.73}\BC{0 .6 0}
  \AA{\AAkeystroke{%
    if(!event.willCommit)app.alert(%
      "You chose \"\" + event.change\r
      + "\"\"+", which has an export value of "
      + event.changeEx);}]myList}{1in}{55bp}
  [(1)(Socks)][(2)(Shoes)][(3)(Pants)][(4)(Shirt)][(5)(Tie)]}
```

²This flag really is not useful unless you have the full Acrobat application, the Sort items check box is checked in the Options tab of the Fields Properties dialog for the field. Initially, the items are listed in the same order as listed in the #5 argument; the Acrobat application will sort the list if you view the *Fields Properties* for the field and click OK. Be sure to save the changes.

- **Combo Boxes**

A combo box is a drop down list of items that can optionally have an editable text box for the user to type in a value other than the predefined choices.

```
\comboBox[#1]{#2}{#3}{#4}{#5}
```

Parameter Description:

#1: optional, used to enter any modification of appearance/actions

#2: the title of the combo box

#3: the width of the bounding rectangle

#4: the height of the bounding rectangle

#5: an array of appearance/values of list

The fifth parameter needs more explanation. The value of this parameter which defines the items in the list—their appearance text and their export values—take two forms:

1. An array of arrays:

```
[(v1)(item1)][(v2)(item2)]...[(vn)(itemn)]
```

The first entry in the two member array is the export value of the item, the second is the appearance text of that item.

2. An array of strings:

```
(item1)(item2)...(itemn)
```

In this case, the export value is the same as the appearance text.

Default Appearance: The default appearance of a standard combo box is determined by the following:

```
\W{1}\S{I}\F{\FPrint}\BC{0 0 0}
```

Key Variables: The first (optional) parameter can be used to modify the default appearance of a list and to add some actions. Following is a list of the variables used within the brackets of this optional argument for the list box: `\Ff`, `\F`, `\TU`, `\W`, `\S`, `\R`, `\BC`, `\BG`, `\mkIns`, `\textFont`, `\textSize`, `\textColor`, `\DV` and `\V`, `\A` and `\AA`. See the [Support Key Variables](#) table for descriptions and notes on each of these variables.

► **\Ff Field flags.** Values appropriate to a combo box are `\FfEdit` (allows the user to type in a choice); `\FfDoNotSpellCheck` (turn spell check off, applicable only if `\FfEdit` is set); `\FfCommitOnSelChange` (commits immediately after selection); and `\FfSort` (sorts the items, see [footnote 2](#), page 12). See the [Appendix](#) for a complete list of values for the `Ff` flag.

Global Modification: `\everyComboBox{<KV-pairs>}`

Example 6. Editable combo box (Version 5.0):

```
\comboBox[\Ff\FfEdit\DV{1}\V{1}
\BG{0.98 0.92 0.73}\BC{0 .6 0}]{myCombo}{1in}{11bp}
{[(1)(Socks)][(2)(Shoes)][(3)(Pants)][(4)(Shirt)][(5)(Tie)]}\kern1bp%
% Follow up with a pushbutton
\pushButton[\BC{0 .6 0}\CA{Get}\AC{Combo}\RC{Box}\A{\JS{\getComboJS}}]
{myComboButton}{33bp}{11bp}
```

The JavaScript action for the button is given below:

```
\begin{defineJS}{\getComboJS}
var f = this.getField("myCombo");
var a = f.currentValueIndices;
if ( a == -1 )
    app.alert("You've typed in \"" + f.value + "\".");
else
    app.alert("Selection: " + f.getItemAt(a, false)
        + " (export value: " + f.getItemAt(a, true)+").");
\end{defineJS}
```

2.3. Text Fields

A text field is the way a user can enter text into a form.

```
\textField[#1]{#2}{#3}{#4}
```

Parameter Description:

- #1: optional, used to enter any modification of appearance/actions
- #2: the title of the text field
- #3: the width of the bounding rectangle
- #4: the height of the bounding rectangle

Default Appearance: The default appearance of a standard text field is determined by the following:

```
\F{\FPrint}\BC{0 0 0}\W{1}\S{S}
```

Key Variables: The first (optional) parameter can be used to modify the default appearance of a text field and to add some actions. Following is a list of the variables used within the brackets of this optional argument for the text field: `\Ff`, `\F`, `\TU`, `\Q`, `\W`, `\S`, `\MaxLen`, `\R`, `\BC`, `\BG`, `\mkIns`, `\textFont`, `\textSize`, `\textColor`, `\DV`, `\V`, `\A`, `\AA` and `\rawPDF`. See the [Supported Key Variables](#) table for descriptions and notes on each of these variables.

► **\Ff Field flags.** There are several values appropriate to a text field: `\FfMultiline` (create a multiline text field); `\FfPassword` (create a password field); `\FfFileSelect`

(select a file from the local hard drive as the value of the text field, PDF 1.4); `\FfComb` (if set, the text field becomes a comb field, the number of combs is determined by the value of `\MaxLen`, PDF 1.5); `\FfDoNotSpellCheck` (automatic spell check is not performed, PDF 1.4); `\FfDoNotScroll` (disable the scrolling of long text, this limits the amount of text that can be entered to the width of the text field provided, PDF 1.4); `\FfRichText` (allows rich text to be entered into the text field, PDF 1.5).

Global Modification: `\everyTextField{<KV-pairs>}`

Example 7. Enter Name:

```
\textField
  [\BC{0 0 1}\BG{0.98 0.92 0.73}
   \textColor{1 0 0}
  ]{myText}{1.5in}{12bp}
```

Example 8. An example of a calculation using a Calculate script. (Calculate works correctly with drivers dvips, dvipsone, or dvipdfm are used.)

Number 1:

Number 2:

Total:

The listing for this list of three text fields is

```
\textField[\AA{%
  \AAKeystroke{AFNumber_Keystroke(1,1,0,0,"",true)}
  \AAFormat{AFNumber_Format(1,1,0,0,"",true)}}
]{num.1}{1in}{11bp}
\textField[\AA{%
  \AAKeystroke{AFNumber_Keystroke(1,1,0,0,"",true)}
  \AAFormat{AFNumber_Format(1,1,0,0,"",true)}}
]{num.2}{1in}{11bp}
\textField[\AA{%
  \AAKeystroke{AFNumber_Keystroke(1,1,0,0,"",true)}
  \AAFormat{AFNumber_Format(1,1,0,0,"",true)}
  \AACalculate{AFSimple_Calculate("SUM", new Array("num"))}
]{sum}{1in}{11bp}
```

2.4. Signature Fields

A signature field is a field that can be digitally signed.

```
\sigField[#1]{#2}{#3}{#4}
```

Parameter Description:

- #1: optional, used to enter any modification of appearance/actions
- #2: the title of the signature field
- #3: the width of the bounding rectangle
- #4: the height of the bounding rectangle

Default Appearance: The default appearance of a standard signature field is determined by the following:

```
\F{\FPrint}\BC{}\BG{}\W{1}\S{S}
```

Key Variables: The first (optional) parameter can be used to modify the default appearance of a signature field and to add some actions. Following is a list of the variables used within the brackets of this optional argument for the signature field: `\F`, `\TU`, `\W`, `\S`, `\R`, `\Lock`, `\BC`, `\BG`, `\mkIns`, `\textFont`, `\textSize`, `\textColor`, `\DV`, `\A`, `\AA` and `\rawPDF`. See the [Supported Key Variables](#) table for descriptions and notes on each of these variables.

Global Modification: `\everySigField{<KV-pairs>}`

Example 9. Sign here:

```
\sigField[\BC{0 0 0}]
{mySig}{2in}{4\baselineskip}
```

To sign this field, use the Acrobat user interface, or use the package `aeb_pro`, and the following docassembly code:

```
\begin{docassembly}
\sigInfo{
  cSigFieldName: "mySig", ohandler: security.PPKLiteHandler,
  cert: "D_P_Story.pfx", password: "dps017",
  oInfo: { location: "Niceville, FL",
    reason: "I am approving this document",
    contactInfo: "dpstory@acrotex.net",
    appearance: "My Signature" }
};
\signatureSign
\end{docassembly}
```

- `cSigFieldName` is the name of the field to be signed.
- `ohandler` is the name of the security handler to be used to sign the field, usually, this is `security.PPKLiteHandler`; `security.PPKLiteHandler` is used if `ohandler` is not listed in the property list.

- `cert` is the name of the Digital ID certificate file to be used. The extension for this file is `.pfx` (Windows) and `.p12` (Mac OS). These files reside in the folder,

```
app.getPath( {cCategory:"user"})/Security
```

However, just enter the file name, such as `cert: "D_P_Story.pfx"`.

- `password`: The Digital ID requires a password to access and to use. For example: `password: "dps017"`.
- `oInfo` is a JavaScript object with various properties to be filled in, `location`, `reason`, `contactInfo`, and `appearance`. The `appearance` is important, through it, you can choose a particular appearance for the digital signature, including a custom signature that you've created. In the example above, we have `appearance: "My Signature"`. `My Signature` is the name I've given a particular digital ID of mine. If the `appearance` property is not included in `oInfo`, Acrobat will use the one named `"Standard Text"`.

Important: Additional information on signatures can be found at the [Acrobat Developer Center](#); or go to the [Security page](#); in particular, see the document *Digital Signature User Guide for Acrobat 9.0 and Adobe Reader 9.0*. Other comments on the topic of signature fields:

- The open key `\textSize` is recognized, but is change to 0.
- The Signed tab of the Digital Signatures Properties dialog box, lists an entry titled "This script executes when the field is signed." This JavaScript is implemented through the format script of the AA key. Thus,

```
\AA{\AAFormat{console.println("Signed!");}}
```

places message in the console when the field is signed.

- The `\Lock` key can be used to lock various fields when the document is signed.

```
1 \Lock{/Action/All}
2 \Lock{/Action/IncludeFields{<field1>,<field2>,...}}
3 \Lock{/Action/ExcludeFields{<field1>,<field2>,...}}
```

- In (1), all fields are locked when the signature field is signed.
- In (2), only the listed fields are locked when the signature field is signed.
- In (3), all fields, except the ones listed, are locked when the signature field is signed.

2.5. Obtaining a uniform look across all workflows

In this section, several commands are presented that help you layout PDF forms, as created by eforms, in a way that is consistent across all workflows (dvips/Distiller, pdflatex, lualatex, and xelatex).

<code>\makeXasPDOn</code>	<code>\makeXasPDOff</code>	❶
<code>\makePDasXOn</code>	<code>\makePDasXOff</code>	❷
<code>\o1Bdry</code>	<code>\cgBdry*[\length]</code>	❸
<code>\vo1Bdry</code>	<code>\vcgBdry[\length]</code>	❹
<code>\efKern{\length₁}{\length₂}</code>		❺

Matching dimensions of form fields. The form fields created by xelatex are smaller than the ones with the same dimensions created the other PDF creators (pdflatex, lualatex, or dvips/Distiller). To obtain a uniform look across all workflows, you can either increase the size of the xelatex form fields, or decrease the size of the form fields created by non-xelatex workflows. The first two lines of the display (❶ and ❷) address the issue that different workflows produce different sized form fields even though their dimensions are the same.

- Expanding the command `\makeXasPDOn` increases the size of the form fields created by xelatex to make them the same size as those created by the other applications pdflatex or; while `\makeXasPDOff` turns off this feature, the fields created by xelatex are smaller than the ones otherwise created by the other workflows.

The eforms package expands `\makeXasPDOn` as the default behavior.

- Expanding the command `\makePDasXOn` decreases the size of the created by non-xelatex workflows to make them the same size as those created by xelatex; while `\makeXasPDOff` turns off this feature, the fields created by non-xelatex workflows are larger than the ones created by xelatex.

Setting the horizontal relationship between fields. When one form field follows another on the same line, the space between them becomes an issue. There are three problems addressed in this paragraph:

*`\o1Bdry`
described,
illustrated*

- You want the two fields, which have the same border thickness (usually 1 bp), to overlap borders, like so,

```
\textField{txt1}{30bp}{10bp}\o1Bdry
\textField{txt2}{30bp}{10bp}
```

use the `\o1Bdry` command (**overlay boundary**), as listed in line ❸ in the display above. Overlapping the border lines is only useful if the border colors are the same.

*`\cgBdry`
described,
illustrated*

- When the border colors are different, you can place neighboring fields contiguously. To make the field have contiguous border lines, use the `\cgBdry` command (**contiguous boundary**), as listed in line ❹ in the above display.

```
\textField[\BC{red}]{txt3}{30bp}{10bp}\cgBdry
\textField[\BC{blue}]{txt4}{30bp}{10bp}
```

\o1Bdry
continued

- The third case is where you want the field to be separated by a nonzero length, in this case, the optional first argument `\cgBdry[⟨length⟩]` is used; `\cgBdry` positions the two neighboring field contiguously, then moves the right-field `⟨length⟩` to the right.

```
\textField{txt5}{30bp}{10bp}\cgBdry[1in]
\textField{txt6}{30bp}{10bp}
```

The two fields are separated by 1 inch.

\vo1Bdry
described

\vcgBdry
described

Setting the vertical relationship between fields. In a similar manner, the space between two fields on consecutive lines may be precisely controlled. Both `\vo1Bdry` and `\vcgBdry` (line ❹ in the display) start a new paragraph. The `\vo1Bdry` command positions the two fields so that their borders exactly overlap (assuming the same border width), while the `\vcgBdry` command positions them so the borders are contiguous. The optional argument for `\vcgBdry[⟨length⟩]` allows for a separation of exactly `⟨length⟩`, assuming `\parskip` is 0 pt.

```
⟨field1⟩\vo1Bdry⟨field2⟩      (overlay borders)
```

```
⟨field1⟩\vcgBdry⟨field2⟩      (contiguous borders)
```

```
⟨field1⟩\vcgBdry[6pt]⟨field2⟩ (6pt separation)
```

*\vcgBdry**
described

If `\parskip` is not 0 pt, use the star form, `\vcgBdry*[⟨length⟩]`, on the last line of form fields; when the star argument is present, `\vcgBdry` performs the subtraction `⟨length⟩ - \parskip`, in that way, there is exactly `⟨length⟩` of vertical space between the last form field and the next paragraph.

On the `\efKern` command. The `\efKern` command listed in above display, line ❺, is a general command that can be used to induce driver-dependent spacing. It is designed to provide spacing between fields and gives finer control over the “intelligent” and automatic spacing provided by `\o1Bdry` and `\cgBdry`. When *not compiled* with the `xetex` option, `\efKern` expands to `\kern⟨length1⟩`, and when *compiled with* the `xetex` option, `\efKern` expands to `\kern⟨length2⟩`.

3. Link Annotations

The eforms package has several link commands that are sufficiently general that they can be given arbitrary appearances, and can perform a wide range of actions.

The borders of the link commands can be controlled through optional parameter, their default appearance follow the same pattern of hyperref: If the `colorlinks` option is used (in hyperref) then the border is invisible by default; otherwise, there is a visible border.

When the `colorlinks` option is chosen (in hyperref), the link text is colored using the command `\defaultlinkcolor`, this is a named color. `\defaultlinkcolor` has a definition of

```
\newcommand{\defaultlinkcolor}{\@linkcolor}
```

where `\@linkcolor` is a command defined in hyperref, and is defined to be red. This can be redefined as desired.³

The first link command is a general link for text, or any L^AT_EX content. It is used, for example, by the `aeb_mlink` package to create multiple-line links.

```
\setLink[options]{link_text}
\setLinkText[options]{link_text}
```

Both link commands are the same, the use of the second one, `\setLinkText` (grayed out), is discouraged in favor of the use of `\setLink`.

Parameter Description: The command has two arguments, the first is optional. The first parameter takes key-value pairs to change appearance and define actions. The default appearance of this link is `\S{S}\Border{0 0 0}`, an invisible yet solid border line. (The visibility of the border is actually controlled by the `colorlinks` option of hyperref, as explained above.) The second parameter is the link text. This argument does not have to be text, it can be anything that takes up space, such as a graphic or `\parbox`.

Example 10. Push me!

```
\setLink[\A{\JS{app.alert("AcroTeX rocks!")}}
\linktxtcolor{blue}\Color{0 0 1}\W1\S{U}\H{P}]{Push me!}
```

 Additional examples of `\setLink` may be found in the rather comprehensive article *Support for Links in AeB/eForms*, [aeb_links.pdf](#), found on the AcroT_EX Blog website.

The next link command is a convenience command to put the link content into a parbox, the parameters enable you to set the width, height and position of material in the box.

```
\setLinkBbox[options]{width}{height}
[position]{link_content}
```

³The Web package redefines `\@linkcolor` to be a flavor of green.

Parameter Description: The command has five arguments, the first is optional.

options are optional key-value pairs to change the appearance or action of this link.

width is the width of the `\parbox`.

height is the height of the `\parbox`.

position is the positioning parameter of the `\parbox` (b, c, t).

link_content is the text or object to be enclosed in a `\parbox`

Example 11. [Press Me!](#)

```
\setLinkBbox[\W{1}\Color{1 0 0}
  \A{\JS{app.alert("Thank you for using AcroTeX!")}}
]{50bp}{30bp}[c]{\centering Press Me!}
```

4. Actions

A form field may simply gather data from the user; additionally, it may perform one or more *actions*. Actions include execute JavaScript code, going to a particular page in a document, open a file, execute a menu item, reset a form, play media or a sound, and so on. Beginning with Acrobat 5.0, most actions can be performed using JavaScript methods.

An action is initiated by a *trigger*, a field may have many actions, each with a separate trigger. The different triggers are discussed in [Trigger Events](#), and the various types of actions available are covered in the section [Action Types](#).

4.1. Trigger Events

Event actions are initiated by *triggers*. For fields, there are ten different triggers.

- 1. Mouse Enter:** The event is triggered when mouse enters the region defined by the bounding rectangle. The `\AAMouseEnter` key is used within the argument of `\AA` to define a mouse enter event:

```
\textField[\AA{\AAMouseEnter{%
  \JS{app.alert("You've entered my text field, get out!")}}}]
{myText}{1.5in}{12bp}
```

- 2. Mouse Exit:** The event is triggered when mouse exits the region defined by the bounding rectangle. The `\AAMouseExit` key is used within the argument `\AA` to define a mouse exit event:

```
\textField[\AA{\AAMouseExit{%
  \JS{app.alert("You've exited my domain, never return!")}}}]
{myText}{1.5in}{12bp}
```

- 3. Mouse Down:** The event is triggered when the (left) mouse button is pushed down while the mouse is within the bounding rectangle of the field. The `\AAMouseDown` key is used within the argument of `\AA` to define a mouse down event:

```
\pushButton[\AA{\AAMouseDown{\JS{app.alert("Mouse Down!")}}}]
{myButton}{30bp}{12bp}
```

- 4. Mouse Up:** The event is triggered when the (left) mouse button is released while the mouse is within the bounding rectangle of the field. The `\A` key (or `\AAMouseUp` key is used within the argument of `\AA`) is used to define a mouse up event:

```
\pushButton[\A{\JS{app.alert("Mouse Up!")}}]
{myButton}{30bp}{12bp}
```

The same code can be performed as follows:

```
\pushButton[\AA{\AAMouseUp{\JS{app.alert("Mouse Up!")}}}]
{myButton}{30bp}{12bp}
```

When both types of mouse up actions are defined for the same field, the one defined by `\A` is the one that is executed.

- 5. On Focus:** The event is triggered when the field comes into focus (either by tabbing from another field, or clicking the mouse within the bounding rectangle). The `\AAOnFocus` key is used within the argument of `\AA` to define an 'on focus' event:

```
\textField[\AA{\AAOnFocus{\JS{%
  app.alert("Please enter some data!")}}}]
{myText}{1.5in}{12bp}
```

- 6. On Blur:** The event is triggered when the field loses focus (either by tabbing to another field, by clicking somewhere outside the field, or (in the case of a text field, for example) pressing the Enter button). The `\AAOnBlur` key is used within the argument of `\AA` to define an 'on blur' event:

```
\textField[\AA{\AAOnBlur{%
  \JS{app.alert("Thanks for the data, I think!")}}}]
{myText}{1.5in}{12bp}
```

- 7. Format:** The format event is the event that occurs when text is entered into a text or combo box; during this event, optionally defined JavaScript code is executed to format the appearance of the text within the field. The `\AAFormat` key is used within the argument of `\AA` to define a format event:

```

\textField[\AA{%
  \AAKeystroke{AFNumber_Keystroke(2,0,1,0,"\\u0024",true);}
  \AAFormat{AFNumber_Format(2,0,1,0,"\\u0024",true);}}]
{myText}{1.5in}{12bp}

```

The above example creates a text field which will accept only a number into it and which will format the number into U.S. currency.

8. **Keystroke:** This keystroke event is the event that occurs when individual keystroke is entered into a choice field (list or combo) or a text field; during this event, optionally defined JavaScript can be used to process the keystroke. The `\AAKeystroke` key is used within the argument of `\AA` to define a keystroke event; see the format example above.
9. **Validate:** The validate event is an event for which JavaScript code can be defined to validate the data that has been entered (text and combo fields only). The `\AAValidate` key is used within the argument of `\AA` to define a validate event:

```

\textField[\AA{%
  \AAKeystroke{AFNumber_Keystroke(2,0,1,0,"\\u0024",true);}
  \AAFormat{AFNumber_Format(2,0,1,0,"\\u0024",true);}
  \AAValidate{%
    if (event.value > 1000 || event.value < -1000) {\r\t
      app.alert("Invalid value, rejecting your value!");\r\t
      event.rc = false;\r
    }}
}] {myText}{1.5in}{12bp}

```

10. **Calculate:** The calculate event is an event for which JavaScript code can be defined to make automatic calculations based on entries of one or more fields (text and combo fields only). The `\AACalculate` key is used within the argument of `\AA` to define a calculate event:

```

\textField[\AA{%
  \AAKeystroke{AFNumber_Keystroke(2,0,1,0,"\\u0024",true);}
  \AAFormat{AFNumber_Format(2,0,1,0,"\\u0024",true);}
  \AACalculate{AFSimple_Calculate("SUM",new Array("Prices"));}
}] {myText}{1.5in}{12bp}

```

11. **PageOpen:** (The **PO** key, Table 8.10, PDF 1.5) An action to be performed when the page containing the annotation is opened (for example, when the user navigates to it from the next or previous page or by means of a link annotation or outline item). The action is executed after the page's open action. The `\AAPageOpen` key is used within the argument of `\AA` to define an annotation page open event:
12. **PageClose:** (The **PC** key, Table 8.10, PDF 1.5) An action to be performed when the page containing the annotation is closed (for example, when the user navigates to the next or previous page, or follows a link annotation or outline item). The action

is executed before the page's close action. `\AAPageClose` key is used within the argument of `\AA` to define an annotation page close event.

13. **PageVisible:** (The **PV** key, Table 8.10, PDF 1.5) An action to be performed when the page containing the annotation becomes visible in the viewer application's user interface. `\AAPageVisible` key is used within the argument of `\AA` to define an annotation page visible event.
14. **PageInvisible:** (The **PI** key, Table 8.10, PDF 1.5) An action to be performed when the page containing the annotation is no longer visible in the viewer application's user interface. `\AAPageInvisible` key is used within the argument of `\AA` to define an annotation page invisible event.

Below is a simple example of usage. The actions write to the console.

```
\textField[\AA{%
  \AAPageOpen{console.println("Page \thepage: PO");}
  \AAPageClose{console.println("Page \thepage: PC");}
  \AAPageVisible{console.println("Page \thepage: PV");}
  \AAPageInvisible{console.println("Page \thepage: PI");}
}]{tf\thepage}{2in}{11bp}
```

Additional examples appear in the file `eqforms.tex`.

4.2. Action Types

The following is only a partial listing of the action types, as given in Table 8.36 of the *PDF Reference* [5]. The entire list and the details of usage can be obtained from the *PDF Reference*.

Action Type	Description
<code>GoTo</code>	Go to a destination in the current document
<code>GoToR</code>	Go to a destination in another document
<code>Launch</code>	Launch an application, usually to open a file
<code>URI</code>	Resolve a uniform resource identifier
<code>Named</code>	Execute an action predefined by the viewer
<code>SubmitForm</code>	Send data to a uniform resource locator
<code>JavaScript</code>	Execute a JavaScript script (PDF 1.3)

Examples of each type of action follow.

- ▶ **GoTo:** Go to a (named or explicit) destination within the current document. In this example, we 'go to' the named destination `toc.1`, which references the table of contents pages. This button goes to a *named destination*:

```
\pushbutton[\CA{Go}\AC{Now!}\RC{to TOC}
  \A{/S/GoTo/D(toc.1)}]{myButton1}{10bp}
```

For a named destination, the value of the `/D` key is a string, (`toc.1`) in the above example, that specifies the destination name.

The following is an example of an *explicit destination*:

```
\pushButton[\CA{Go}\AC{Now!}\RC{to Page 3}
\A{/S/GoTo/D[{Page3}/Fit]}\myButton1}\{10bp}
```

The value of the destination key `/D` is an array referencing a page number (`{Page3}`) and a view (`/Fit`).

For a `GoTo` action, the first entry in the destination array, `{Page3}`, is an indirect reference to a page, the notation `{Page3}` is understood by the distiller. For `dvipdfm`, use the `@page` primitive:

```
\makeatletter\def\Page#1{@page#1}\makeatother
\pushButton[\CA{Go}\AC{Now!}\RC{to Page 3}
\A{/S/GoTo/D[\Page3/Fit]}\myButton1}\{10bp}
```

`pdftex` has no mechanism for inserting indirect page references.

See section 8.5.3, ‘Go-To Actions’, of the *PDF Reference* [5] for details of the syntax of `GoTo`, and section 8.2.1 for documentation on explicit and named destinations.

► **GoToR**: Go to a (named or explicit) destination in a remote document. In this example, we ‘go to a remote’ destination, a *named destination* in another document.

```
\pushButton[\CA{Go}\AC{Now!}\RC{to TOC}
\pushButton[\CA{Go}\AC{Now!}\RC{to TOC}
\A{/S/GoToR/F(webeqtst.pdf)/D(webtoc)]\myButton2}\{10bp}
```

This example illustrates an *explicit destination*; the following button jumps to page 3 in another document:

```
\pushButton[\CA{Go}\AC{Now!}\RC{to Page 3}
\A{/S/GoToR/F(webeqtst.pdf)/D[2/Fit]}\myButton2}\{10bp}
```

The value of the destination key `/D` is an array referencing a page number and a view (`/Fit`).

For an *explicit destination*, the *PDF Reference* [5] specifies that the first entry in the destination array should be a page number (as contrasted with an indirect reference to a page number, for the case of `GoTo`). The destination, `/D[2/Fit]` would correctly work for distiller, `dvipdfm` and `pdftex`.

See section 8.5.3, ‘Remote Go-To Actions’, of the *PDF Reference* [5] for details of the syntax of `GoToR`, and section 8.2.1 for documentation on explicit and named destinations.

► **Launch**: Launch an application (‘Open a file’). In this example, we open a `TEX` file using the application associated with the `.tex` extension:

```
\pushButton[\CA{Go}\AC{Now!}\RC{to TOC}
\A{/S/Launch/F(webeqtst.tex)]\myButton3}\{10bp}
```

See section 8.5.3, ‘Launch Actions’, of the *PDF Reference* [5] for details of the syntax.

► URI: Open a web link. In this example, we go to the Adobe web site:

```
\pushButton[\CA{Go}\AC{Adobe!}\RC{To}
\A{/S/URI/URI(http://www.adobe.com/)}]{myButton4}{}{10bp}
```

See section 8.5.3, ‘URI Actions’, of the *PDF Reference* [5] for details of the syntax.

Acrobat (Adobe Reader) also support open parameters, using these key-value pairs, we can go to a specific page in a PDF on the web, and even search for words, for example opens the AeB Manual on the Internet, goes to page 8, and searches for the words AcroTeX, web, and exerquiz.

```
\pushButton[\CA{Go & Search}
\A{/S/URI/URI(http://www.math.uakron.edu/~dpstory/
acrotex/aeb_man.pdf#page=8&search=AcroTeX web exerquiz)}]
{myButton4a}{}{10bp}
```

The same can be accomplished using `\setLink`.

► Named: Execute a ‘named’ action (i.e., a menu item). Named actions listed in the *PDF Reference* are `NextPage`, `PrevPage`, `FirstPage` and `LastPage`. A complete list of named actions can be obtained by executing the code `app.listMenuItems()` in the JavaScript console of Acrobat (Pro).

```
\pushButton[\CA{Go}\AC{Previous!}\RC{To}
\A{/S/Named/N/PrevPage}]{myButton5}{}{10bp}
```

See section 8.5.3, ‘Named Actions,’ of the *PDF Reference* [5] for details of the syntax. The named actions listed in the PDF Reference are `NextPage`, `PrevPage`, `FirstPage`, and `LastPage`.

In theory, any menu item can be executed as a named actions; there are several factors to be taken into consideration: (1) Not all menu items available to Acrobat are listed on the menu bar of Adobe Reader, when choosing a name event to use, you should decide if the application executing the named action supports that action; (2) In recent versions, starting with version 7, there have been security restrictions on the execution of menu items, the so-called “white list.” Only named actions listed on the white list are allowed to execute. The white list for version 8.0 is

Named Actions on Whitelist

AcroSendMail:SendMail	LastPage	ShowHideToolbarCommenting
ActualSize	NextPage	ShowHideToolbarData
AddFileAttachment	OneColumn	ShowHideToolbarEdit
BookmarkShowLocation	OpenOrganizer	ShowHideToolbarEditing
Close	PageSetup	ShowHideToolbarFile
CropPages	PrevPage	ShowHideToolbarFind
DeletePages	Print	ShowHideToolbarForms
ExtractPages	PropertyToolbar	ShowHideToolbarMeasuring
Find	Quit	ShowHideToolbarNavigation
FindCurrentBookmark	ReplacePages	ShowHideToolbarPageDisplay

Named Actions on Whitelist

FindSearch	RotatePages	ShowHideToolbarPrintProduction
FirstPage	SaveAs	ShowHideToolbarRedaction
FitHeight	Scan	ShowHideToolbarTasks
FitPage	ShowHideAnnotManager	ShowHideToolbarTypewriter
FitVisible	ShowHideArticles	SinglePage
FitWidth	ShowHideBookmarks	Spelling
FullScreen	ShowHideFields	Spelling:Check
GeneralInfo	ShowHideFileAttachment	TwoColumns
GeneralPrefs	ShowHideModelTree	TwoPages
GoBack	ShowHideOptCont	Web2PDF:OpenURL
GoForward	ShowHideSignatures	ZoomTo
GoToPage	ShowHideThumbnails	ZoomViewIn
InsertPages	ShowHideToolbarBasicTools	ZoomViewOut

In addition to the Whitelist for version 8, the following menu items are added for version 9.

Named Actions on Whitelist

Annots:Tool:InkMenuItem	CollectionShowRoot	HandMenuItem
CollectionDetails	DocHelpUserGuide	HelpReader
CollectionHome	GoBackDoc	rolReadPage
CollectionPreview	GoForwardDoc	ZoomDragMenuItem

As mentioned before, some of these are for Acrobat only, others are available for Adobe Reader. I'll let you sort them out. If you try to execute a named action that is not on the white list, the action will silently fail.

► **SubmitForm:** Submit forms Action. In this example, we submit a URL to a CGI, which then sends the requested file back to the browser:

Note: This script no longer works, server-side scripting at the `uakron.edu` server is no longer permitted (for security reasons). The verbatim listing of the code as it used to be when it worked.

```
\definePath{\URL}{http://www.math.uakron.edu/~dpstory}
\comboBox[\DV{\URL}\V{\URL}\BG{webyellow}\BC{webgreen}]
{dest}{1.75in}{11bp}{%
  [(\URL)( Homepage of D. P. Story)]
  [(\URL/acrotex.html)( AcroTeX Homepage)]
  [(\URL/webeq.html)( AcroTeX Bundle)]
  [(\URL/acrotex/examples/webeqtst.pdf)(Exerquiz Demo file {(PDF)})]
}\kern1bp\pushButton[\BC{webgreen}\CA{Go!}]
\A{/S/SubmitForm/F(http://www.math.uakron.edu/cgi-bin/nph-cgiwrap/%
dpstory/scripts/nph-redir.cgi)/Fields[(dest)]/Flags 4}]
{redirect}{33bp}{11bp}
```

See section 8.6.4 of the *PDF Reference* [5] for details of the syntax for 'Submit Actions'.

- ▶ **JavaScript:** Execute a JavaScript action. This is perhaps the most important type of action. In this example, the previous example is duplicated using the `Doc.getURL()` method, we don't need to submit to a CGI.

```
\definePath{\URL}{http://www.math.uakron.edu/~dpstory}
\comboBox[\DV{\URL}\V{\URL}\BG{webyellow}\BC{webgreen}]
{dest}{1.75in}{11bp}{%
  [(\URL)( Homepage of D. P. Story)]
  [(\URL/acrotex.html)( AcroTeX Homepage)]
  [(\URL/webeq.html)( AcroTeX Bundle)]
  [(\URL/acrotex/examples/webeqtst.pdf)(Exerquiz Demo file {(PDF)})]}
}\kern1bp\pushButton[\BC{webgreen}\CA{Go!}]
\A{\JS{%
  var f = this.getField("dest");\r
  app.launchURL(f.value,false);
}}}{redirect}{33bp}{11bp}
```

Note the use of the convenience command `\JS`, defined in the `insdljs` package, it expands to the correct syntax: `/S/JavaScript/JS(#1)`, where `#1` is the argument of `\JS`.

Most all actions can be performed using JavaScript, the reader is referred to the *JavaScript for Acrobat API Reference* [4].

5. JavaScript

Acrobat JavaScript is the cross-platform scripting language of the Acrobat suite of products. For Acrobat 5.0 or later, Acrobat JavaScript based on JavaScript version 1.5 of ISO-16262 (formerly known as ECMAScript), and adds extensions to the core language to manipulate Acrobat forms, pages, documents, and even the viewer application.

Web-based references to core JavaScript are the *Core JavaScript Guide* [1] and the *Core JavaScript Reference* [2]. For Acrobat JavaScript, we refer you to the *Developing Acrobat Applications using JavaScript* [3] and the *JavaScript for Acrobat API Reference* [4].

5.1. Support of JavaScript

The **AcroTeX eDucation Bundle** has extensive support for JavaScript, not only for JavaScript executed in response to a field trigger, but for document level and open page actions as well. As the topic of this document is eForm support, the reader is referred to the documentation in the `insdljs` package, which is distributed with the **AcroTeX Bundle**.

- **The Convenience Command `\JS`**

The syntax for writing JavaScript actions is

```
\pushButton[\A{/S/JavaScript/JS(\script)}]
{jsEx}{22bp}{11bp}
```

Notice the code is enclosed in matching parentheses. As noted earlier, [AcroTeX](#) defines the command `\JS` as a convenience for this very common actions; the above example becomes:

```
\pushButton[\A{\JS{\script}}]{jsEx}{22bp}{11bp}
```

The code is now enclosed in matching braces.

• Inserting Simple JavaScript

Actions are introduced into a field command through its optional first parameter. JavaScript actions, in particular, can be inserted by a mouse up⁴ action, for example, using the `\A` and `\JS` commands.

The “environment” for entering JavaScript is not a verbatim environment: ‘\’ is the usual TeX escape character and expandable commands are expanded; active characters are expanded (which is usually not what you want); and primitive commands appear verbatim (so you can use, for example, ‘{’ and ‘}’). Within the optional argument, the macro `\makeJSSpecials`, which can be redefined, is expanded; the macro makes several special definitions: (1) it defines `\\` to be ‘\’; (2) defines `\r` to be the JavaScript escape sequence for new line; and (3) defines `\t` to be the JavaScript escape sequence for tab.

Example 12.

The verbatim listing for this button is

```
\pushButton[\CA{Sum}\A{\JS{%
  var n = app.response("Enter a positive integer",
    "Summing the first \\\"n\\\" integers");\r
  if ( n != null ) {\r\t
    var sum = 0;\r\t
    for ( var i=1; i <= n; i++ ) {\r\t\t
      sum += i;\r\t
    }\r
  app.alert("The sum of the first n = " + n
    + " integers is " + sum + ".", 3);
  }
}]{jsSum}{22bp}{11bp}
```

Code Comments. Within the JavaScript string, we want literal double quotes “”, to avoid “” being interpreted as the end of the string (or the beginning of a string) we have to double escape the double quotes, as in `\\`. (This is not necessary when entering code in the JavaScript editor if you have the Acrobat application.) I try to write JavaScript that I can easily read, edit, and debug in the JavaScript editor (available in the full Acrobat application); for this reason, I’ve added in new lines and tabbing (`\r` and `\t`). Many people, however, have only the Adobe Reader and cannot see their code to debug it; in this case, the formatting is really not needed.

⁴Other types of possible actions are discussed and illustrated in ‘[Actions](#)’ on page 21.

Needless to say, the following sample will not compile because we do not have matching braces.

```
\pushButton[\A{\JS{var x = "{"}}]{jsBrace}{22bp}{11bp}
```

The work around here is

```
\pushButton[\A{\JS{var x = "\jslit\{"}}]{jsBrace}{22bp}{11bp}
```

In the above work about, the `\jslit` command (for JavaScript literal) is used. This command is defined only within the optional arguments of a form field. The definition of `\jslit` is `\let\jslit\string`

• Inserting Complex or Lengthy JavaScript

For JavaScript that is more complex or lengthy, the `insdljs` Package, distributed with the [AcroTeX Bundle](#), has the verbatim `defineJS` environment. Details and idiosyncracies of this environment are documented in ‘[The defineJS Environment](#)’ on page 55. The example given in [Example 6](#) will suffice; the verbatim listing is reproduced here for convenience.

► First, we define the JavaScript action and name it `\getComboJS` for the button (prior to defining the field, possibly in the preamble, or in style files):

```
\begin{defineJS}{\getComboJS}
  var f = this.getField("myCombo");
  var a = f.currentValueIndices;
  if ( a == -1 )
    app.alert("You've typed in \"" + f.value + "\".");
  else
    app.alert("Selection: " + f.getItemAt(a, false)
      + " (export value: " + f.getItemAt(a, true)+").");
\end{defineJS}
```

There is no need for the `\r` and `\t` commands to format the JavaScript; the environment obeys lines and spaces; contrast this example with [Example 12](#), page 29.

Now we can define our fields, a combo box (not shown) and button, in this example. It is the button that uses the JavaScript defined above.

```
\pushButton[\BC{0 .6 0}\CA{Get}\AC{Combo}\RC{Box}
  \A{\JS{\getComboJS}}]{myComboButton}{33bp}{11bp}
```

Within the argument of `\JS` we insert the macro command, `\JS{\getComboJS}` for our JavaScript defined earlier in the `defineJS` environment

 The demo file [aeb_links.pdf](#), with source attached, is found on the [AcroTeX Blog](#) website.

5.2. Defining JavaScript Strings with `\f1JSStr` and `\d1JSStr`

The `insdljs` package defines `\f1JSStr` and `\d1JSStr` to help create JavaScript strings that contain Latin 1 glyphs (or for the general purpose of defining JavaScript strings).

<code>\f1JSStr*[\options]{\<cmd>}{\<JS_string>}</code>	(Field level)
<code>\d1JSStr*[\options]{\<cmd>}{\<JS_string>}</code>	(Document level)

The previously documented `\defineJSStr` command is now an alias for `\f1JSStr`. Each command defines a new command `\<cmd>` with body `JS_string`. The command `\f1JSStr` is designed to define JavaScript strings that are passed through the optional argument of a form field or link annotation, whereas `\d1JSStr` is used for a Document JavaScript string, that is, one that is inserted into a `insDLJS` environment of the `insdljs` package. Document JavaScript is implemented differently depending on the driver used, as a result, `\d1JSStr` is more driver dependent than is `\f1JSStr`.

Options discussed. When the optional star (*) is present, the `JS_string` argument is passed to `\pdfstringdef` before the definition of `\<cmd>`. The `options` argument may consist of one or more of the keywords `quotes`, `noquotes`, `parens`, `noparens`. By default, `\<JS_string>` is enclosed in double quotes, unless the option `noquotes` is taken. The `parens` option causes `insdljs` to enclose `JS_string` in parentheses; while `noparens` specifies not to enclose the string in parentheses. The default is `noparens`.

Command Description: Prior to defining `\<cmd>`, there are a number of definitions that occur locally:

- `\uXXXX` is recognized as a unicode escape sequence. So, within the JavaScript string, unicode can be entered directly, for example, `\u00FC` is the u-umlaut.
- Backslash is still the tex escape character, so any commands in the JavaScript string get expanded. You can delay the expansion by using `\protect`. Expansion occurs when the tex compiler actually expands `\<CMD>`.
- `\r` (carriage return), `\n` (line feed) and, `\t` (tab) can be used to format the message, as desired.
- Use the `\cs` command to write a word containing a literal backslash in it; for example, to get `\LaTeX` to appear in a JavaScript string, you must type `\cs{LaTeX}` in the JavaScript string.
- The JavaScript string is enclosed in double quotes ("), if you want a literal double quote, use `\"` to get a literal double quote to appear in a JavaScript string. For example,

```
\f1JSStr{\myMessage}
  {My name is \"Stan\" and I'm \"the man.\"}
```

- The command `\jslit` is recognized within the JavaScript string. Using `\jslit` (short for JavaScript literal), you can insert, for example, unbalanced braces:

```
\flJSStr{\myMessage}
  {You forgot the left brace \\"\jslit\{\{" ,
   please insert it.}
```

The definition of `\jslit` is `\let\jslit\string`.

6. The `useui` option: A User-Friendly Interface

To use the “user-friendly” interface, the `useui` option must be taken. The key-value pairs described below are enclosed as the argument of the special `\ui` key. For example,

```
\pushButton[\ui{%
  bordercolor={1 0 0},bgcolor={0 1 0},
  textcolor={1 0 0},align={right},
  uptxt={Push Me},
  js={app.alert("AcroTeX rocks")}
}]{pb1}{11bp}
```

You can develop your own set of appearances and use the `presets` key to conveniently set these. For example,

```
\def\myFavFive{%
  bordercolor={1 0 0},bgcolor={0 1 0},
  textcolor={1 0 0},align={right},
  uptxt={Push Me}
}
```

Later, a push button can use this preset, like so,

```
\pushButton[\ui{presets=\myFavFive,
  js={app.alert("AcroTeX rocks!")}}]{pb1}{11bp}
```

which produces ⁵

You can mix your `\myFavFive` with different key-value pairs, such as a JavaScript action.

- In each of the subsequent subsections, the `eforms` key to its user-friendly counterpart is displayed in the margin. Some of the user-friendly are a combination of `eforms` KVs and are not represented in the margin in this case.

6.1. The Appearance Tab

We present these key-value pairs to model the user-interface of Acrobat.

```
border=visible|invisible
```

Command Description: Used with link annotations and determines whether the border surrounding the bounding box of the link is visible. In the case of a link, this is the Link

⁵The reader is reminded once again that the author has no understanding of colors.

Type: Visible Rectangle or Invisible Rectangle. If you set `border` equal to `invisible`, that will set border line width to zero $\{0\}$. For forms, this key has no counterpart in the user interface.

If this key is not specified, the `eforms` follows the rule: If `colorlinks` option of `hyperref` is used, the border is invisible; otherwise, it is visible (and the default `linewidth` is 1). Use the `border` key to override this behavior.

`\W` `linewidth=thin|medium|thick`

Command Description: The `linewidth` of the border around a link or a form. The user interface choices are `thin`, `medium`, and `thick`. This key-value is ignored if the document author has set the border to `invisible`.

`\H` `highlight=none|invert|outline|inset|push`

Command Description: The highlight type for links and forms, choices are `none`, `invert`, `outline`, `inset` and `push`. The term `inset` is used with links, and `push` is used with forms. They each have the same key value pair.

`\BC` (forms) or
`\Color` (links)

`bordercolor=<num>_<num>_<num>`

Command Description: The color of the border, when visible, in RGB color space. For example, `bordercolor=1 0 0`, is the color red.

`\S` `linestyle=solid|dashed|underlined|beveled|inset`

Command Description: The line style of the border, possible values are `solid`, `dashed`, `underlined`, `beveled`, and `inset`. Links do not support the `beveled` option.

`\D` `dasharray=<num>[_<num>]`

Command Description: When a line style of `dashed` is chosen, you can specify a dash array. The default is 3.0, which means a repeating pattern of 3 points of line, followed by 3 points of space. A value of `dasharray=3 2` means three points of line, followed by two points of space. When this key is used without a value, the value is 3.0. When the `dashed` key is not present, 3.0 is used.

`linktxtcolor`

`\linktxtcolor` `linktxtcolor=<named_color>`

Command Description: Set the color of the link text. Ignored if the `colorlinks` option of `hyperref` has not been taken. The value of `linktxtcolor` is a named color. For example, `linktxtcolor=red`. The default is `\@linkcolor` from `hyperref`. This default can be changed by redefining `\@linkcolor`, or redefining `\defaultlinkcolor`. If `linktxtcolor={}` (an empty argument), or simply `linktxtcolor`, no color is applied to the text, the color of the text will be whatever the current color is.

`\F` `annotflags=hidden|print|-print|noview|lock`

Command Description: This is a bit field, possible values are `hidden`, `print`, `-print`, `noview`, and `lock`. *Multiple values can be specified.* The values are “or-ed” together.

Most all forms are printable by default. If you don't want a form field to print specify `-print`. For example, `annotflags={-print,lock}` makes the field not printable and is locked, so the field cannot be moved through the UI.

`\Ff` `fieldflags=readonly|required|noexport|multiline|password|notoggleoff|radio|pushbutton|combo|edit|sort|fileselect|multiselect|nospellcheck|noscrolling|comb|radiosinunison|commitonchange|richtext`

Command Description: There are a large number of field flags (Ff) that set a number of properties of a field. This is a multiple-selection key as well. The values are “or-ed” together.

Normally, a document author would not specify `radio`, `pushbutton` or `combo`. These properties are used by `eforms` to construct a radio button field, a push button and a combo box. The others can be used as appropriate.

`\MaxLen` `maxlength=<num>`

Command Description: Use `maxlength` to limit the number of characters input into a text field. Example: `maxlength=12`. When the `fieldflags` is set to `comb`, the value of `maxlength` determines the number of combs in the field.

`\TU` `tooltip=<string>`

Command Description: Enter a text value to appear as a tool tip. A tool tip is text that appears in a frame when the user hovers the mouse over the field. The link annotation does not have a tool tip feature. Enclose in parentheses if the text string contains a comma; for example, `tooltip={Hi, press me and see what happens!}`. The `tooltip` key obeys the `unicode` option. If the `unicode` option of `hyperref` is in effect, then setting

```
tooltip = {J\"{u}rgen, press me and see what happens!}
```

yields a tool tip of “Jürgen, press me and see what happens!”

`\DV` `default=<string>`
`\V` `value=<string>`

Command Description: Set default value of a field (text, list, combobox) using the `default` key. The default value is the value used for the field when the field is reset. Example: `default=Name`.

The `value` key is used to set the current value of a field (text, list, combobox). Example: `value=AcroTeX`.

These two keys obey the `unicode` option. If the `unicode` option of `hyperref` is in effect, then setting `value = \texteuro\ 1 000 000` sets the (initial) value of this field to “€ 1 000 000”.

`\R` `rotate=0|90|180|270`

Command Description: Set the orientation of the field, values are 0, 90, 180 and 270. If 90 or 270 are chosen, the height and width of the field need to be reversed. This is not done automatically by `eforms`

```
\BG bgcolor=<num>_<num>_<num>
```

Command Description: The background color of a form field. This is a RGB color value.

```
\CA uptxt=<string>
\AC downtxt=<string>
\RC rollovertxt=<string>
```

Command Description: The normal (mouse up), mouse down and rollover text for a button field. All three of these keys obey the `unicode` option. If the `unicode` option of `hyperref` is in effect, then setting `uptxt = J\{u}rgen` yields a normal caption of “Jürgen” on the button.

Push buttons only. The following list of keys are used for creating custom appearances on button faces. Acrobat Distiller required for this set. The example files `eqforms.pdf` and `eqforms_pro.pdf` illustrate the creation of icons as button appearances. In the latter PDF, `eqforms_pro.pdf`, Acrobat Distiller is required to be the PDF creator.

```
\I normappr=<string>
\RI rollappr=<string>
\IX downappr=<string>
\importIcons importicons=<yes|no>
```

Command Description: The normal, rollover, and down appearances of the button face icon. The value of each key is an indirect reference to a form XObject. Normally, you can use the `graphicxsp` package to embed graphics and give a symbolic name which is used as the value of these keys. `importIcons` is a special key used in conjunction with importing icons using JavaScript methods.

```
\TP layout=labelonly|icononly|icontop|iconbottom|
      iconleft|iconright|labelover
```

Command Description: The value of this key determines the layout of the icon relative to the label (or caption). The default is `labelonly`, if if you define icons, you need to set `layout` to something other than `labelonly`.

```
\SW scalewhen=always|never|iconbig|iconsmall
```

Command Description: The value of this key tells when to scale the icon. The `iconbig` scales the icon when it is too big for the bounding rectangle; while `iconsmall` scales the icon when it is too small for the bounding rectangle. The default is `always`.

\ST `scale=proportional|nonproportional`

Command Description: This parameter sets the scale type, either `proportional` scaling, where the aspect ratio of the icon is preserved; or `nonproportional` scaling is used. The default is `proportional`.

\PA `position=x y`

Command Description: Both *x* and *y* are numbers between 0 and 1, inclusive, and separated by a space (not a comma). They indicate the fraction of the left over space to allocate at the left and bottom of the icon. A value of `{0.0 0.0}` positions the icon at the bottom-left corner; a value of `{0.5 0.5}` centers it within the rectangle. This entry is only used if the icon is scaled proportionally. The default is `{0.5 0.5}`.

\FB `fitbounds=true|false`

Command Description: A Boolean value, if `true`, indicates that the button appearance should be scaled to fit fully within the bounds of the field's bounding rectangle without taking into consideration the line width of the border. The default is `false`. `fitbounds` is the same as `fitbounds=true`.

Check boxes and Radio Buttons Only. The following list of keys are used for creating custom appearances on check boxes and radio buttons. Acrobat Distiller required for this set. The example files `eqforms.pdf` and `eqforms_pro.pdf` illustrate the creation of these appearances. In the latter PDF, `eqforms_pro.pdf`, Acrobat Distiller is required to be the PDF creator.

\AP `appr={ norm={on={ normOnAppr }, off={ normOffAppr }},
down={on={ downOnAppr }, off={ downOffAppr }},
roll={on={ rollOnAppr }, off={ rollOffAppr }}}`

Command Description: The `norm` key is the normal appearance of the button; it has two appearances, the `on` and the `off` appearances. The `on` and `off` are indirect references to a form XObject. The other two keys, `down` and `roll`, are the down and rollover appearances, respectively; they have the same structure as `norm` does.

If `appr` is not specified, then, by default, the usual appearances of the buttons are used, as provided by Acrobat/AR.

The `down` and `roll` are optional, if you use `appr` at all, you should specify the `norm` appearance, both `on` and `off` appearances.

\Q `align=left|centered|right`

Command Description: The type of alignment of a text field. Permitted values are left, centered, and right.

```
\textFont textfont=<font_name>
\textSize textsize=<num>
\textColor textcolor=<num>[_<num>_<num>[_<num>]]
```

Command Description: The key `textfont` is the text font to be used with the text of the field, while `textsize` is the text size to be used. A value of 0 means auto size. The color of the text in the field. This can be in G, RGB or CMYK color space by specifying 1, 3 or 4 numbers between 0 and 1.

```
\autoCenter autocenter=yes|no
```

Command Description: This is a feature of `eforms`. Use `autocenter=yes` (the default) to moderately center the bounding box, and use `autocenter=no` otherwise.

```
\inline inline=yes|no
```

Command Description: Same as `\autoCenter` (`autocenter`), but the algorithm for positioning the field is more sophisticated. The default is `autocenter=no`

To compare the last two (`autocenter` and `inline`), we present the following example:

Enter your name: _____ (`inline=yes`)

Enter your name: _____ (`autoCenter=yes`)

```
\presets presets=\CMD
```

Command Description: Set `presets` from inside a `\ui` argument. The value of `\ui` must be a user defined command, which expands to a comma-delimited list of `ui-key-value` pairs.

Example 13. Use the `presets` key to place pre-defined key-value pairs into the option argument of a link. Define a command,

```
\def\myUIOpts{%
  border=visible,linktxtcolor=blue,
  linewidth=medium,highlight=outline,
  linestyle=dashed,bordercolor={1 0 0},
  js={app.alert("AcroTeX rocks!")}
}
```

Later, we can type,

```
\setLink[\ui{presets={\myUIOpts}}]{Press Me Again!!}
```

```
\symbolchoice symbolchoice=check|circle|cross|diamond|square|star
```

Command Description: Used with a checkbox or radio button field. This sets the symbol that appears in the field when the box is checked. Choices are `check`, `circle`, `cross`, `diamond`, `square`, and `star`.

`\rectW` `rectW=<length>`

Command Description: Resets the width of the field to `<length>`.

`\rectH` `rectH=<length>`

Command Description: Resets the height of the field to `<length>`.

`\width` `width=<length>`

Command Description: Sets the width of the field to `<length>` and resets the height to maintain the same aspect ratio of the field. For example,

```
\pushButton{pb}{.5in}{1in}           % width of .5in and height of 1in
\pushButton[\width{1in}]{pb}{.5in}{1in} % width of 1in and height of 2in
\pushButton[\ui{width=1in}]{pb}{.5in}{1in} % same as above
```

`\height` `height=<length>`

Command Description: Sets the height of the field to `<length>` and resets the width to maintain the same aspect ratio of the field.

`\scalefactor` `scalefactor=<pos-num>`

Command Description: Multiplies the width and height of the field by a scale factor of `<pos-num>`. For example, setting `scalefactor=2` doubles the length of the width and height of the field.

6.2. The Action Tab

There are several common actions that are supported through the user-friendly interface, these are goto actions, and JavaScript actions.

`goto={KV-pairs}`

Command Description: This key incorporates jumps to pages and destinations within the current PDF file, and to pages and destinations to another PDF file. these are

Key-Value Pairs: There are a number of key-value pairs that are recognized, `file`, `targetdest`, `labeldest`, `page`, `view`, and `open`. A brief description of each follows.

1. `file`: Specify a relative path to the PDF file. This will work on the Web if the position is the same relative to the calling file. If the `file` key is not present, the jump is to a page or destination in the current file.
2. `url`: This key is used to create a weblink, similar to what `\href` does. The value of this key is a url (`http`, `https`, `mailto`, etc.). If the `url` key is present, only the `openparams` key is recognized.

3. `openparams`: Open parameters that should be included with the URL, as passed by the `url` key. These parameters are key value pairs `key=value` and are separated by an ampersand (&). See *Parameters for Opening PDF Files* for more information, examples are found below.
4. `targetdest`: Jump to a target, perhaps created by `\hypertarget`. For example, if we say `\hypertarget{acrotex}{Welcome!}`, we jump to the acrotex named destination by specifying `targetdest=acrotex`.
5. `labeldest`: Same as `targetdest`, but we jump to a destination specified by a latex label. For example, if we type `\section{AcroTeX}\label{acrotex}`, we can jump to this section by specifying `labeldest=acrotex`.
6. `page`: The page number to which the goto action is to jump. If we set `page=1`, we will jump to the first page of the document.
7. `view`: The view can be set when the `page` key is used. Possible values are `fitpage`, `actualsize`, `fitwidth`, `fitvisible`, and `inheritzoom`. These terms correspond to Acrobat's UI. When jumping to a destination, the view is set by the destination code.
8. `open`: This key is used when you specify the `file` key. The `open` key determines if a new window is opened or not when the PDF viewer jumps to the file. Possible values are `userpref` (use user preferences), `new` (open new window), `existing` (use the existing window).

Example 14. The following are examples of the goto key.

- **AeB Manual**

```
\setLink[\ui{goto={file=aeb_man.pdf,page=8,%
view=fitwidth}}]{AeB Manual}
```

This link should work on your local hard drive and it should work on the web, from within a web browser, assuming `aeb_man.pdf` is in the same folder as `eformman.pdf`.

- **AeB Manual on Web**

```
\setLink[\ui{%
goto={url=http://www.math.uakron.edu/~dpstory/%
acrotex/aeb_man.pdf,%
openparams={page=8&search=AcroTeX web exerquiz}}]
]{AeB Manual on Web}
```

Here, we open the AeB Manual that is on the web, go to page 8, and search for the words AcroTeX, web, and exerquiz. Notice that we don't have to do anything special with the tilde (~) or the sharp (#), both of these are handled by the `eforms` package.

`\A{\JS{script}}` `js={script}`

Command Description: A general purpose key to execute JavaScript actions on a mouse up trigger. The argument is a JavaScript text string, for example,

```
js={app.alert("Hello World!")}
```

The value of `js` may be a macro containing JavaScript, which would include a macro created by the `defineJS` environment of `insdljs`.

```
mouseup={script}
mousedown={script}
onenter={script}
onexit={script}
onfocus={script}
onblur={script}
format={script}
keystroke={script}
validate={script}
calculate={script}
pageopen={script}
pageclose={script}
pagevisible={script}
pageinvisible={script}
```

Command Description: These are all additional actions (AA) of a form field, which take as their values JavaScript code (`{script}`).

- `mouseup`: Executes its code with a mouse up event. If there is a JavaScript action defined by the `js` key (or the `\A` key), the `js` (`\A`) action is executed.
- `mousedown`: Executes its code when the mouse is hovering over the field and the user clicks on the mouse.
- `onenter`: Executes its code when the user moves the mouse into the form field (the bounding rectangle).
- `onexit`: Executes its code when the user moves the mouse out of the form field (the bounding rectangle).
- `onfocus`: Executes its code when the user brings the field into focus.
- `onblur`: Executes its code when the user brings the field loses focus (the user tabs away from the field, or click outside the field).
- `format`: JavaScript to format the text that appears to the user in a text field or editable combo box.
- `keystroke`: JavaScript to process each keystroke in a text field or editable combo box.

- `validate`: JavaScript to validate the committed data input into a text field or editable combo box.
- `calculate`: JavaScript to make calculations based on the values of other fields.
- `pageopen`: JavaScript that executes when the page containing the field is opened.
- `pageclose`: JavaScript that executes when the page containing the field is closed.
- `pagevisible`: JavaScript that executes when the page containing the field first becomes visible to the user.
- `pageinvisible`: JavaScript that executes when the page containing the field is no longer visible to the user.

6.3. The Signed Tab

A signature field has a Signed tab. On that tab is an option to mark a set of fields as readonly (locked). The locked key controls that option.

`\Lock`

Command Description: The `lock` key is used with signature fields; use the `action` key (with supported values of `all`, `include`, and `exclude`) and the `fields` key to determine the lock action.

```
% lock all fields in the doc
lock={action=all}
% lock all fields listed by fields key
lock={action=include,fields={{field1},{field2},...}}
% lock all fields not listed by fields key
lock={action=exclude,fields={{field1},{field2},...}}
```

Another option that is included in the Signed tab is titled “This script executes when field is signed.”

This is an option that, through the user interface, is mutually exclusive from locking fields. This option is implemented through the format event; thus, to populate this option with JavaScript use the `format` key. For example,

```
format={app.alert("Thank you for signing this field.");}
```

Setting the Tab Order

The `taborder` package is an internal AeB package that is called by both the `eforms` and the `annot_pro` packages. The `taborder` package sets the tab order for form fields and link annotations (when the link is created by the command `\setLink`, defined in the `eforms` package). The package works for all drivers when setting tab order by column, row, or widget order. For setting tabbing order by structure, only documents generated using the `pdfmark` are supported; those using the `dvips` or `dvipsone` driver along with Adobe Distiller.

7. Setting the Tab Order

The tabbing order of the fields is usually the order in which the fields were created. In rare cases, it may be desirable to set the order to one of the orders defined by the PDF Reference.

```
\setTabOrder{c|C|r|R|s|S|w|W|a|A|unspecified}
```

Command Description: Command Description: This command is page oriented, it sets to the tab order of fields on the page the TEX compiler executes this command. The permissible values of the parameter are described below, taken verbatim from the *PDF Reference*, the cross-references that appear in the descriptions are references to the *PDF Reference* document.

- `c|C` (column order): “Annotations are visited in columns running vertically up and down the page. Columns are ordered by the `Direction` entry in the viewer preferences dictionary (see Section 8.1, ‘Viewer Preferences’). The first annotation visited is the one at the top of the first column. When the end of a column is encountered, the first annotation in the next column is visited.”
- `r|R` (row order): “Annotations are visited in rows running horizontally across the page. The direction within a row is determined by the `Direction` entry in the viewer preferences dictionary (see Section 8.1, ‘Viewer Preferences’). The first annotation visited is the first annotation in the topmost row. When the end of a row is encountered, the first annotation in the next row is visited.”
- `s|S` (structure order): “Annotations are visited in the order in which they appear in the structure tree (see Section 10.6, ‘Logical Structure’). The order for annotations that are not included in the structure tree is application-dependent.”
- `w|W` (version 9.0, widget order): “Widget annotations are visited in the order in which they appear in the page `Annots` array, followed by other annotation types in row order.”
- `a|A` (version 9.0, annotations array order): “All annotations are visited in the order in which they appear in the page `Annots` array.” (In version 9.0, this key is not implemented.)

- `unspecified|empty` The tab order follows the order of the annotations as listed in the `Annots` array. For LATEX, this is the order in which the annotations were created. You get the same result if the argument is left empty `\setTabOrder{}`, or if `\setTabOrder` is not used at all. If an unrecognized argument is passed to `\setTabOrder`, `unspecified` is used.

The behavior of tabbing has changed over the years; documentation of tabbing behavior is given in the *Adobe Supplement to the ISO 32000, BaseVersion 1.7, ExtensionLevel 3*.⁶ See the section Errors and Implementation Notes. Annotations include things like form fields (widget annotations), links (link annotations) and the various types of comment annotations. See section 8.4.5 of the PDF Reference.

The `\setTabOrder` command is available for users of `pdftex` and `dvipdfm`, as well as users of `dvipsone` and `dvips` (with `distiller`); for `row`, `column`, and `widget` (version 9 or later), the PDF viewer does all the work on tabbing, for tabbing using `structure`, one necessarily needs `structure`, otherwise, the tabbing follows row order. For users of Adobe Distiller, the `taborder` package provides two ways for defining the structure order; on any page in which `structure` order is used, use only one of the following commands:

```
\setTabOrderByList
\setTabOrderByNumber
```

7.1. Using `\setTabOrderByList`

We illustrate with a simple example, followed by a verbatim listing of the code, and a discussion afterward. We begin by placing two text fields in a row; normally, we would tab from the first one created by the T_EX compiler to the next one created. We use `structure` to reverse the order of tabbing.

The verbatim listing of the above form fields follows:

```
\setTabOrder{s}      % set tab order to structure
\setTabOrderByList  % the default initially

\textField[\V{text1}\objdef{otext1}]{text1}{1.25in}{11bp}\l[3bp]
\textField[\V{text2}\objdef{otext2}]{text2}{1.25in}{11bp}

\setStructTabOrder{% The list of the fields in the desired order
  {otext2}
  {otext1}
}
```

We begin by specifying `\setTabOrder{s}` `structure` tab order. In the optional argument of the two text fields, we specify an object name for each. These names must be unique

⁶http://www.adobe.com/devnet/acrobat/pdfs/PDF3200_2008.pdf

throughout the whole document; they are used to reference the fields when setting up the tabbing order.

The `\setStructTabOrder` is used to set up the tabbing order, its arguments (enclosed in braces) consists of a list of object names (which must exist on the current page). The order of the object names is the order of visitation when you tab. PDF objects not referenced are visited last after the structure tabbing is complete.

After all annotations have been created on a page, we use the `\setStructTabOrder` to actually set the tab order; this is none by simply listing the object names, in the desired order, of the annotations you want included in the tabbing order. These annotations can be fields, links, and markup comments, like sticky notes.

The syntax for `\setStructTabOrder` is

```
\setStructTabOrder{%
  [type=<type>,title=<title>]{<oRef_1>}
  [type=<type>,title=<title>]{<oRef_1>}
  ...
  [type=<type>,title=<title>]{<oRef_n>}
}
```

Each argument has an optional argument, the required argument (`<oRef_i>`) is an object name of a previously defined PDF object, such as a form field (widget), a link, or an annotation. The optional argument takes two optional key-value pairs: (1) The `type` is a declaration of the type the PDF object is, the default is `Form` (you can use `Link` if its a link, and `Annot` if its a comment); (2) `title` is the title of the structure, the value of title appears in the Tags panel of the Acrobat user interface. The default title is to have no title.

The demo file is [settaborder.pdf](#) for these tabbing features, including tabbing using structure, has its source file attached to the PDF file. The file is posted one the [AeB Blog](#).

7.2. Using `\setTabOrderByNumber`

An alternate method for setting tab order by structure is to directly enter the tab order into the optional argument of the field, link, or comment annotation.

The verbatim listing of the above form fields follows:

```
\setTabOrder{s} % set tab order to structure
\setTabOrderByNumber

\textField[\V{text3}\objdef{otext3}\taborder{1}]
  {text3}{1.25in}{11bp}\[3bp]
\textField[\V{text3}\objdef{otext4}\taborder{0}]
  {text4}{1.25in}{11bp}
```

Note the user of the `\objdef` and `\taborder` keys. The latter is used to set the order of tabbing.

Important: When setting tab order, there must be an object with `\taborder{0}`; from what I've been able to observe, if no PDF object has tab order zero, the tabbing reverts to what is listed in the Annots array, which is the order the PDF objects were created. If you specify 0, 0, 1, 2, 3..., then the two PDF objects with tab order of 0 are visited in the order they were created. Similarly, for the other tab values. A tab order of 0, 2, 3, 4...seems to work as well. The object labeled 2 will be visited after the object labeled 0.

The demo file is [settaborder1.pdf](#) for these tabbing features, including tabbing using structure, has its source file attached to the PDF file. The file is posted on the [AeB Blog](#).

Document and Page JavaScript

The `insdljs` package provides support to \LaTeX in four areas:

1. for embedding document level JavaScript into the PDF file created from a \LaTeX source, the `insDLJS` environment.
2. for creating open page actions that are executed when the document is first opened to the first page, the `\OpenAction` command.
3. for writing JavaScript code in an environment that preserves the formatting of the code, this is the `defineJS` environment.
4. for executing JavaScript code once to perform post-distillation tasks, this is the `execJS` environment. This environment works only for document authors that use Acrobat/Acrobat Distiller to create PDF files.

This package defines a new environment, `insDLJS`, used for inserting Acrobat JavaScript into a PDF file created from a \LaTeX source. This package works correctly for users of `pdflatex`, `lualatex`, or `xelatex`. For document authors that use the workflow

```
tex -> dvi -> dvips -> ps -> <Distiller|ps2pdf> -> PDF viewer (1)
```

*Acrobat
required*

to create a PDF document, if the document (or one of the packages it imports) uses Document JavaScripts created by this package, at the end of the above workflow, the PDF viewer *is required to be* Acrobat.⁷ The role of Acrobat is to embed the Document JavaScripts in the document for the workflow of `display (1)`. It is necessary to install the folder JavaScript file `aeb.js` (read `install_jsfiles.pdf` for instructions) and to possibly configure Acrobat (read `acrobat-in-workflow.pdf` to see how to do this). For additional discussion on this workflow, refer to the section titled “Concerning the use of Acrobat” in the [AeB Manual](#).

8. Package Options

The `insdljs` supports five common “drivers”: `dvipsone`, `dvips`, `pdftex` (including the executable `lu(la)tex`), `dvipdfm`, `dvipdfmx`, `xetex`, and `textures`. When using `dvips`, Acrobat Distiller and Acrobat (version 5.0 or later) are required to embed the JavaScripts at the document level. The other drivers have primitives that allow the embedding of the JavaScripts.

Other options are discussed in the following paragraphs.

`nodljs` turns off the embedding of the document level JavaScript. This might be useful, for creating a paper document that is not interactive. For a non-interactive paper document, no JS is needed.

`execJS` is a very useful option/feature if you know how to use it. Any JavaScript that is written in an `execJS` environment is executed once when the document is first

⁷Other PDF creation workflows do not require Acrobat to embed Document JavaScripts

opened in Acrobat, then discarded. AeB uses this for post-distillation document processing. The default is that the JavaScript in an `execJS` environment is not executed; using this option turns on this feature.

`useAltAdobe` imports alternate naming for most of Adobe’s built in functions. All of Adobe built in functions begin with ‘AF’, when this option is taken, the same functions are defined, but prefixed with ‘EF’. For example, `AFNumber_Keystroke()` has an alias of `EFNumber_Keystroke()`, when the `useAltAdobe` option is specified.

Developer’s Note. Use this option when developing new code that use the Adobe built-in functions. For developers that have Acrobat, it is useful to specify this option and to refer to the built-in function using the special syntax,

```
\d1@EForAF4<no-AF-function-name>
```

For example, `\d1@EForAF4Number_Keystroke(0,0,0,0,"",true)` expands to

```
EFNumber_Keystroke(0,0,0,0,"",true)
```

if `useAltAdobe` is taken, and

```
AFNumber_Keystroke(0,0,0,0,"",true)
```

otherwise.

`debug` causes the document JavaScript created by the Acrobat Bundle to generate more debugging messages to the JavaScript console.

9. The `insDLJS` and `insDLJS*` Environments

These are the main environments defined by this package. There are two forms of the document level environment, the `insDLJS` and the `insDLJS*`. First, we discuss what a document JavaScript is.

9.1. What is Document Level JavaScript?

The document level is a location in the PDF document where scripts can be stored. When the PDF document is opened, the document level functions are scanned, and any “exposed script” is executed.

Normally, the type of scripts you would place at the document level are general purpose JavaScript functions, functions that are called repeatedly or large special purpose functions. Functions at the document level are known throughout the document, so they can be called by links, form buttons, page open actions, etc.

Variables declared within a JavaScript function have local scope, they are not known outside that function. However, if you can declare variables and initialize them at the document level outside of a function, these variables will have document wide scope. Throughout the document, the values of these global variables are known. For example, suppose the following code is at the document level:

```

var myVar = 17;          // defined outside a function, global scope
function HelloWorld()
{
  var x = 3;            // defined inside a function, local scope
  app.alert("AcroTeX, by Hech!", 3);
}

```

Both the function `HelloWorld()` and the variable `myVar` are known throughout the document. The function `HelloWorld()` can be called by a mouse up button action; some form field, executing some JavaScript, may access the value of `myVar` and/or change its value. The variable `x` is not known outside of the `HelloWorld()` function.

9.2. The insDLJS Environment

The `insDLJS` is the simplest of the two environments. Any material within the environment, eventually ends up in the DLJS section of the PDF document.

The environment takes the *base_name* and writes the file *(base_name).djs*. This file contains a verbatim listing of the JavaScript within the environment, plus some lines that change catcodes. The file is then input into the document at `\AtBeginDocument`.

The case of `dvipsone` and `dvips` is a little different. A *(base_name).djs* is written and input back, and a second file *(base_name).fdf* is written. The second file is later input into the PDF document after distillation.

The syntax of usage for this environment, which takes three arguments, is given next.

```

\begin{insDLJS}[js_var]{base_name}{script_name}
...
  <JavaScript functions or exposed code>
...
\end{insDLJS}

```

Environment Description: JavaScript code is written within the `insDLJS` environment. The code is stored as document-level JavaScript, and is global to the document. Functions and variables defined at the top-most level are known to other form elements in the document.

The `insDLJS` is a verbatim environment, with backslash (`\`) and percentage (`%`) maintaining their usual \LaTeX meaning. Commands defined in the \LaTeX source file, therefore, are expanded before the JavaScript is embedded in the PDF file. The left and right braces are set to normal characters, so the commands can't have any argument, they should be just text macros.

Parameter Description: The environment takes three parameters, the first is optional, but required when using the Acrobat Distiller.

`[js_var]` is an optional parameter *was required* for the `dvipsone` and `dvips` options; otherwise it is ignored. Its value must be the name of one of the functions or JavaScript variables defined in the environment. This is used to detect whether the DLJS has already been loaded by Acrobat.

- The `[js_var]` is now optional even for users of `dvipson` and `dvips`. If one is not provided, then appropriate code is automatically generated.

base_name is an alphabetic word with no spaces and limited to eight characters.⁸ It is used to build the names of auxiliary files and to build the names of macros used by the environment.

script_name is the name of the JavaScript that you are embedding in the document. This title will appear in the document JavaScript dialog in Acrobat; unless you use Acrobat, you can't see this name in the user interface anyway. The *script_name* should be a string that is descriptive of the functionality of the code.

Commenting. Within the `insDLJS` environment, there are two types of comment characters: (1) a \TeX comment (`%`) and (2) a JavaScript comment. The JavaScript comments are `'/'`, a line comment, and `'/*...*/'` for more extensive commenting. These comments will survive and be placed into the PDF file. In JavaScript the `%` is used as well, use `\%` when you want to use the percent character in a JavaScript statement, for example `app.alert("\%.2f", 3.14159);`, this statement will appear within your JavaScript code as `app.alert("%.2f", 3.14159);`.

Example 15. The following is a minimal illustration of the use of the new environment. Here we assume the document author is using `pdftex`, and is not using the wonderful packages of `web`, `exerquiz` or `eforms`. In this case, the `hyperref` package with driver in the option must be introduced first, followed by `insdljs` with the same driver, of course. The optional argument of the `insDLJS` environment is not used in this example.

```
\documentclass{article}
\usepackage[pdftex]{hyperref}
\usepackage[pdftex]{insdljs}

\newcommand\tugHello{Welcome to TUG 2001!}
\begin{insDLJS}{mydljs}{My Private DLJS}
function HelloWorld() { app.alert("\tugHello", 3); }
\end{insDLJS}
\begin{document}
\begin{Form} % a hyperref environment, needed for \PushButton
% use built in form button of hyperref
Push \PushButton[name=myButton,onclick={HelloWorld();}]{Button}
\end{Form}
\end{document}
```

The `Form` environment and the `\PushButton` command are defined in the `hyperref` package. The `insDLJS` uses the `Form` environment, the `eforms` package defines its own `\pushButton` command.

⁸There is actually no limitation on the number of characters in the name, this is a legacy statement from the days of DOS, you remember DOS, don't you?

Example 16. Here is the same example as above, but with `dvips` as the driver and using the `eforms` package, which calls `insdljs`. Note the use of the optional argument in the `insDLJS` environment, and the missing `hyperref` package statement and `Form` environment, the `eforms` package automatically inserts this code.

```
\documentclass{article}
\usepackage[dvips]{eforms}

\newcommand\tugHello{Welcome to TUG 2001!}
\begin{insDLJS}[HelloWorld]{mydljs}{My Private DLJS}
function HelloWorld() { app.alert("\tugHello", 3); }
\end{insDLJS}
\begin{document}
\pushButton[\CA{Push}\A{\JS{HelloWorld}}]{Button}{}{11bp}
\end{document}
```

9.3. The insDLJS* Environment

The `insDLJS*` environment can be used to better organize, edit and debug your JavaScript. It is suitable for package developers who write a large amount of code package application.

If you have the full Acrobat product, you can open the DLJS edit dialog. There you will see a listing of all DLJS contained in the document. When you double click on one of the *script names*, you enter the edit window, where you can edit all JavaScript contained under that name.

```
\begin{insDLJS*}[js_var]{base_name}
\begin{newsegment}{script_name_1}
  \langle JavaScript functions or exposed code \rangle
\end{newsegment}
\begin{newsegment}{script_name_2}
  \langle JavaScript functions or exposed code \rangle
\end{newsegment}
...
...
\begin{newsegment}{script_name_n}
  \langle JavaScript functions or exposed code \rangle
\end{newsegment}
\end{insDLJS*}
```

Parameter Description: The environment takes two parameters, the first is optional, but required when using the Acrobat Distiller. The nested environment `newsegment` takes one required parameter.

`[js_var]` is an optional parameter, its use is discouraged.

`base_name` is an alphabetic word with no spaces and limited to eight characters. It is used to build the names of auxiliary files and to build the names of macros used by the environment.

script_name_i is the script name (title) that appears in the Document level JavaScript dialog of Acrobat.

9.4. Escaping

JavaScript uses the backslash as an escape character, just as does \TeX . The `insdljs` package tries to make the transition from \TeX to JavaScript as easy as possible. In the table below, is a listing of the more useful characters represented by a backslash.

Sequence	Character represented
<code>\t</code>	horizontal tab (<code>\u0009</code>)
<code>\n</code>	newline (<code>\u000A</code>)
<code>\r</code>	carriage return (<code>\u000D</code>)
<code>\"</code>	double quote (<code>\u0022</code>)
<code>\'</code>	apostrophe or single quote (<code>\u0027</code>)
<code>\\</code>	backslash (<code>\u005C</code>)
<code>\xXX</code>	the Latin-1 character specified by the two hexadecimal digits <code>XX</code>
<code>\uXXXX</code>	the unicode character specified by the four hexadecimal digits <code>XXXX</code>
<code>\XXX</code>	the Latin-1 character specified by the octal digits <code>XXX</code> , between 1 and 377.

Within a JavaScript string, these special characters should be double escaped, `\\`, like so:

```
\pushButton[\textFont{Arial}\CA{Push Me}\A{\JS{%
  app.alert("The \\\"cost\\\" of this package is \\u20AC 0.\\rThis,
  \\\"\\\\\\\\\" is a backslash");
}]{demoEsc}{11bp}
```

Note the double backslash of backslash, which comes out to four, count them four backslashes, `\\\\`.

Again, both JavaScript and \TeX , certain punctuation marks have special meaning; in the case of JavaScript, punctuation has a special meaning within regular expressions:

Special Punctuation in Regular Expressions

`^ $. * + ? = ! : | \ / () [] { }`

When these occur in a regular expression, within a string, they need to be double escaped, `\\`. Outside of a string, they need only be escaped.

Example 17. The following code searches through the string `str` and replaces every occurrence of the period character with `\".`.

```
str = "AcroTeX rocks. AcroTeX rolls."
str = str.replace(/./g, "\\.");
```

When this code is executed, the result is `\"AcroTeX rocks\\. AcroTeX rolls\\.\"`.

Example 18. If one of these special characters appears outside a JavaScript string, within a regular expression pattern, for example, they need only be escaped. The code `(/\)\^\(\/.test(str))` searches the string `str` for any occurrence of “)^(“ and returns `true` if such a pattern is found, `false` otherwise. If `str="(x+1)^(3)"`, the search returns `true`.

9.5. Access and Debugging

For those who do not have Acrobat, the application, unless you are writing very simple code, writing and debugging JavaScript will be very difficult. From the Acrobat Reader, there is no access to the document JavaScript. You will be pretty much writing blind.

Normally, I develop the JavaScript from within Acrobat. The GUI editor does check for syntax errors, giving you a chance to correct some simple errors as you go. After I am satisfied with my code, I copy it from the editor and paste it into a `insDLJS` environment. This is how the JavaScript code of `exerquiz` was developed.

In my opinion, if you want to develop rather complicated code, having the full Acrobat product is a must. (This implies that the Windows or Mac platform is needed!)

9.6. JavaScript References

The JavaScript used by Acrobat consists of the core JavaScript plus Acrobat’s JavaScript extensions. The *Core JavaScript Reference* [2] may be found at [Mozilla Developer Center](#). The documentation for the Acrobat extensions may be found in the guides *JavaScript for Acrobat API Reference* [4] and *Developing Acrobat Applications using JavaScript* [3], both of which I’ve had a hand in writing. These are found at [Acrobat Developer Center](#). (Click on **JavaScript for Acrobat** in the right-hand navigation panel.)

10. Open Action

This package also defines an `\OpenAction` command to introduce actions that are executed when the PDF document is opened on page 1. The open action command only applies to page 1.

```
\OpenAction{action_code}
```

Command Location: This command must appear in the preamble of the document.

Command Description: Executes the action(s) each time page 1 is opened. The argument `<action_code>` is any action subtype, as listed in Section 8.5.3 of the *PDF Reference, sixth edition, PDF 1.7*. Two common types are JavaScript and Named actions. The `\OpenAction` command may be repeated, which will add to the list of open actions to be executed at the opening of page 1.

Special commands are defined in `insdljs`, `\JS` and `\Named`, that make it easy to specify these types of actions.

Example 19. `\OpenAction{\JS{app.alert("Hello World!");}}`

Example 20. You can use `\r` and `\t`—carriage return and tab, respectively—to format multiple lines of JavaScript:

```
\OpenAction{\JS{%
  app.alert("Hello World!");\r
  app.alert("Good Day to You!");
}}
```

Example 21. Multiple `\OpenAction` can be entered. Code is executed in the same order. Here, we show an alert box with a message, then jump to the last page.

```
\OpenAction{\JS{app.alert("AcroTeX rocks the world!");}}
\OpenAction{\Named{LastPage}}
```

For the other pages, beyond page 1, `\thisPageAction` can be used; the command can also be used for page 1 as well (it must go in the preamble).

```
\thisPageAction{open_script}{close_script}
```

Command Location: For page 1, this command must go in the preamble, otherwise, it goes on the page for which it is intended.

Command Description: *open_script* is an action that is to be executed when the current page is opened; *close_script* is an action to be executed when the current page is closed.

Example 22. Below is a simple example of how to use `\thisPageAction`.

```
...
\thisPageAction{\JS{console.println("Open: page 1");}}
  {\JS{console.println("Close: page 1");}}
\begin{document}
page 1
\newpage
page 2
\thisPageAction{\JS{console.println("Open: page 2");}}
  {\JS{console.println("Close: page 2");}}
...
\end{document}
```

When `\thisPageAction` is executed in the preamble, the `<open_action>` argument gets passed to the `\OpenAction` command.

11. The execJS Environment

This is an environment useful to PDF developers who want to tap into the power of JavaScript. To use this environment, the developer needs Acrobat 5.0 or higher. `pdftex` or `dvipdfm` can be used to produce the PDF document, but the developer needs the Acrobat product for this environment to do anything.

The `execJS` is used primarily for post-distillation processing (post-creation processing, in the case of `pdftex` and `dvipdfm`). The `execJS` environment can be used, for example, to automatically import named icons into the document, which can, in turn, be used for an animation.

The `execJS` is an environment in which you can write verbatim JavaScript code. This environment is a variation on `insdljs`, it writes a couple of auxiliary files to disk; in particular, the environment creates an `.fdf` file. When the newly produced PDF is loaded for the first time into the viewer (Acrobat, not Reader), the `.fdf` file generated by the `execJS` environment is imported, and the JavaScript executed. This JavaScript is *not* saved with the document. The syntax of this environment is...

```
\begin{execJS}{name}
....
<JavaScript code>
....
\end{execJS}
```

Parameter Description: The environment takes one required argument, the base name of the auxiliary files to be generated.

Many of the more useful JavaScript methods have security restrictions, the developer must create folder JavaScript that can be used to *raise the privilege* of the methods.

Example 23. Here is an extensive example taken from the AeB Pro distribution. The following code is user folder JavaScript code, see the AeB Pro documentation on how to locate the user JavaScript folder. We define a function `aebTrustedFunctions` that is the interface to accessing the restricted methods.

```
/*
  AEB Pro Document Assembly Methods
  Copyright (C) 2006 AcroTeX.Net
  D. P. Story
  http://www.acrotex.net
  Version 1.0
*/
if ( typeof aebTrustedFunctions == "undefined" ) {
  aebTrustedFunctions = app.trustedFunction(
    function ( doc, oFunction, oArgs ) {
      app.beginPriv();
      var retn = oFunction( oArgs, doc )
      app.endPriv();
      return retn;
    }
  );
}
// Add a watermark background to a document
aebAddWatermarkFromFile = app.trustPropagatorFunction (
  function ( oArgs, doc ) {
    app.beginPriv();
```

```

        return retn = doc.addWatermarkFromFile(oArgs);
    app.endPriv();
});

```

Once this code is installed in the user JavaScript folder, and Acrobat is re-started, the code is ready to be used. The way the code is used is with the `execJS` environment.

```

\def\bgPath{"/C/acrotex/ManualBGs/Manual_AeB.pdf"}
\begin{execJS}{execjs}
    aebTrustedFunctions( this, aebAddWatermarkFromFile,
        {bOnTop: false, cDIPath: \bgPath} )
\end{execJS}

```

This is the code used to prepare this manual. It places a background graphic on each page of the document. When the newly distilled document is first opened in Acrobat, (version 7.0 or higher, is when the privilege bit started to appear), the trusted function `aebTrustedFunctions` is executed with its arguments. Looking at the definition of `aebTrustedFunctions`, what is executed is

```

app.beginPriv();
    return retn = this.addWatermarkFromFile({bOnTop: false,
        cDIPath: "/C/acrotex/ManualBGs/Manual_AeB.pdf"});
app.endPriv();

```

AeB Pro, the AcroTeX Presentation Bundle and @EASE use these `execJS` techniques.

12. The `defineJS` Environment

When you create a form element (button, text field, etc.), you sometimes want to attach JavaScript. The `defineJS` environment aids you in writing your field level JavaScript. It too is a verbatim environment, however, this environment does not write to an auxiliary file, but saves the contents in a token register. The contents of the register are used in defining a macro that expands to the verbatim listing.

```

\begin{defineJS}[\langle chngCats \rangle]{\langle cmd \rangle}
    \langle script \rangle
\end{defineJS}

```

Parameter Description: The `defineJS` environment takes two parameters, the first optional. the required parameter is the command name to be defined. Use the optional first parameter (`\langle chngCats \rangle`) to modify the verbatim environment, as illustrated in the example below. The `\langle script \rangle` is saved under the command name `\langle cmd \rangle`. The `defineJS` is a complete verbatim environment: no escape, and no comment characters are defined. You can use the optional parameter to create an escape character; you can pretty much use any character you wish, *except* the usual one ‘\’, backslash.

Example 24. The following example illustrates the usage of the defineJS environment.

```
% Make @ the escape so we can
% demonstrate the optional parameter.
\def\HelloWorld{Hello World!}
\begin{defineJS}[\catcode'\@=0\relax]{\JSA}
var sum = 0;
for (var i = 0; i < 10; i++)
{
    sum += i;
    console.println("@HelloWorld i = " + i );
}
console.println("sum = "+sum);
\end{defineJS}
\begin{defineJS}{\JSAE}
console.println("Enter the button area");
\end{defineJS}
\begin{defineJS}{\JSAAX}
console.println("Exiting the button area");
\end{defineJS}
\pushButton[\A{\JS{\JSA}}
    \AA{\AAMouseEnter{\JS{\JSAE}}
        \AAMouseExit{\JS{\JSAAX}}}]
]{myButton}{30bp}{15bp}
```

The code lines of \JSAE and \JSAAX are so simple, defineJS environment was really not needed.

See [‘Inserting Complex or Lengthy JavaScript’](#) on page 30 for an additional example of the use of the defineJS environment.

The insdljs package defines two “silent” versions of defineJS, these are @defineJS and defineJS*.

```
\begin{@defineJS}[\langle chngCats \rangle]{\langle cmd \rangle}
    \langle script \rangle
\end{@defineJS}

defineJS* is a public version @defineJS
\begin{defineJS*}[\langle chngCats \rangle]{\langle cmd \rangle}
    \langle script \rangle
\end{defineJS*}
```

Use defineJS* in the body of the document; the command argument \langle cmd \rangle can be silently used and redefined in a later defineJS* environment. The @defineJS environment is for package authors.

The defineJS-type environments with arguments. The defineJS-type environments do not have parameters/arguments as normal environments (or commands) do. To

enable the ability to modify the JavaScript code within the environment of `defineJS`, the command pair `\bParams/\eParams` is defined.

```
\bParams{<token1>}{<token2>}...{<tokenn>}\eParams
```

When you use one of the `defineJS` environments to define field level JavaScript, you can include symbolic parameters/arguments `\p(1)`, `\p(2)`, and so on, within the body of the environment. At the time of expansion of the command `\<cmd>`, a substitution is made: `\p(1)` expands to `<token1>`, `\p(2)` expands to `<token2>`, and so on. Note that the argument of `\p`, which is only locally defined, is enclosed with *parentheses*. Before continuing with the discussion, consider the following example.

```
\begin{defineJS*}[\catcode'\!=0\relax]{\myCode}
var p1=!p(1), p2=!p(2);
app.alert("p1 + p2 = " + Number(p1+p2) );
\end{defineJS*}
```

Within the body of a `defineJS` environment, there is no escape character unless you change catcode of another character within the optional argument of the `defineJS` environment. In the above example, the exclamation mark is declared as the escape.

```
\pushButton[\cmd{\bParams{1}{16}\eParams}
\A{\JS{\myCode}}]{pbf1d1}{.5in}{11bp}
```

When this button is pressed, an alert message appears ‘p1 + p2 = 17’. We can reuse this code later with other parameters:

```
\pushButton[\cmd{\bParams{77}{11}\eParams}
\A{\JS{\myCode}}]{pbf1d2}{.5in}{11bp}
```

Now the message is ‘p1 + p2 = 88’.

In both examples, the special key `\cmd` is used to pass the `\bParams/\eParams` command pair into eforms’ parsing stream; this keeps the declaration local. The `\cmd` key is described in [Appendix C](#), titled ‘Supported Key Variables’, beginning on 60; specifically, `\cmd` is listed in under the heading [Specialized, non-PDF Spec commands](#).

 A comprehensive discussion of the features to the `defineJS` environment is found in the article titled [insdljs: Exploring the defineJS environment](#) from the AcroTeX Blog website.⁹

Appendices

A. The Annotation Flag F

The annotation flag F is a bit field that is common to all annotations.

Annotation Flag F	
Flag	Description
<code>\FHidden</code>	hidden field
<code>\FPrint</code>	print
<code>\FNoView</code>	no view
<code>\FLock</code>	locked field (PDF 1.4)

In the user interface for Acrobat, there are four visibility attributes for a form field. The table below is a list of these, and an indication of how each visibility attribute can be attained through the F.

UI Description	Use
Visible (and printable)	
Hidden but printable	<code>\F{\FNoView}</code>
Visible but doesn't print	<code>\F{\FNoPrint}</code>
Hidden (and does not print)	<code>\F{\FHidden}</code>

- ▶ All fields created by the eForm commands are printable by default.

B. Annotation Field flags Ff

The table below lists some convenience macros for setting the Ff bit field.

Annotation Field flags Ff		
Flag	Description	Fields
\FfReadOnly	Read only field	all
\FfRequired	Required field (Submit)	all
\FfNoExport	Used with Submit Action	all
\FfMultiline	For Multiline text field	text
\FfPassword	Password field	text
\FfNoToggleToOff	Used with Radio Buttons	Radio only
\FfRadio	Radio Button Flag	Radio if set
\FfPushButton	Push Button Flag	Push button
\FfCombo	Combo Flag	choice
\FfEdit	Edit/NoEdit	combo
\FfSort	Sort List	choice
\FfFileSelect	File Select (PDF 1.4)	text
\FfMultiSelect	multiple select (PDF 1.4)	choice
\FfDoNotSpellCheck	Do not spell check (PDF 1.4)	text, combo
\FfDoNotScroll	do not scroll (PDF 1.4)	text
\FfComb	comb field (PDF 1.5)	text
\FfRadiosInUnison	radios in unison (PDF 1.5)	radio
\FfCommitOnSelChange	commit on change (PDF 1.5)	choice
\FfRichText	rich text (PDF 1.5)	text

C. Supported Key Variables

Below is a list of the keys supported for modifying the appearance or for creating an action of a field. If the default value of a key is empty, e.g., `\Ff{}`, then that key does not appear in the widget. The Acrobat viewer may have a default when any particular key does not appear, e.g. `\W{}` will be interpreted as `\W{1}` by the viewer.

In the past, the value of the `\textColor` key must include the color model specification:

- `g` (for gray scale): a single number between 0 and 1; example, `\textColor{.5 g}`
- `rg`: Red Green Blue: a list of three numbers between 0 and 1 giving the components of color; for example `\textColor{.1 .2 .3 rg}`
- `k` Cyan Magenta Yellow [K]Black: a list of four numbers between 0 and 1 giving the components of the color according to the subtractive model used in most printers; for example `\textColor{.1 .2 .3 .4 k}`

In this current version of `eforms`, the color model can be optionally included. The `eforms` package will supply the correct specification as a function of the number of arguments provided. Thus, the examples above can now be written as `\textColor{.5}`, `\textColor{.1 .2 .3}`, and `\textColor{.1 .2 .3 .4}`.

Note: Regarding the keys `\textColor`, `\BG`, `\BC`, and `\Color`¹⁰, beginning with `eforms` dated 2010/07/23 or later, `eforms` now uses the `hicolor` package to process all color keys (listed above); consequently, if the `xcolor` package is also loaded on your system, you can use *named colors* to specify color for the `eforms` keys. For example, if the definition was made

```
\definecolor{myBlue}{rgb}{0.24,0.38,0.68}
```

then each of the following is valid: `\textColor{myBlue}` (for specifying text color for text fields), `\BG{myBlue}` (for specifying the background color of a field), `\BC{myBlue}` (for specifying the border color of a field), and `\Color{myBlue}` (for specifying the border color of a link).

Setting some defaults. Before getting to the specification of the key-values, there are two convenience commands for setting the default text font and text size. These are `\textFontDefault{<font-spec>}` (`\textFontDefault{Helvetica}`) for setting the default text font and `\textSizeDefault{<size>}` (`\textSizeDefault{9}`) for setting the default text size.

¹⁰Information regarding the `\Color` key may be found in [Section 3](#), page 20. The `\Color` key is more fully documented in the rather comprehensive article [Support for Links in AeB/eForms](#) posted on the [AeB Blog](#).

Supported Key Variables

Key	Description	Default
Entries common to all annotations:		
<code>\F</code>	See the annotation F flag Table	<code>\F{}</code>
Border Style Dictionary (BS)		
<code>\W</code>	Width in points around the boundary of the field, for example, <code>\W{1}</code> .	<code>\W{}</code> (same as <code>\W{1}</code>)
<code>\S</code>	Line style, values are S (solid), D (dashed), B (beveled), I (inset), U (underlined); <code>\S{B}</code>	<code>\S{}</code>
<code>\AA</code>	Additional actions, a dictionary. These actions are triggers by mouse up, mouse down, mouse enter, mouse exit, on focus, on blur events; for text and editable combo boxes there is also the format, keystroke, validate and calculate events. The various triggers are discussed in Trigger Events .	<code>\AA{}</code> (no actions)
<code>\A</code>	Action dictionary, use this to define JavaScript actions, as well as other actions, for mouse up events. See Trigger Events for a discussion of the mouse up event.	<code>\A{}</code> (no action)
<code>\Border</code>	Used with link annotations, an array of three numbers and an optional dash array. If all three numbers are 0, no border is drawn	<code>\Border{0 0 0}</code> (no border)
<code>\D</code>	(link annotations) An array of two numbers that set the dash pattern of a link annotation. The default is 3, which means 3 points of line, 3 points gap. A value of <code>\D{3 2}</code> means three points of line, followed by two points of space.	
<code>\AP</code>	Appearance dictionary, used mostly in AcroTeX with check boxes to define the 'On' value.	<code>\AP{}</code>

Key	Description	Default
\AS	Appearance state, normally used with check boxes and radio buttons when there are more than one appearance. Advanced techniques only.	\AS{}

Entries common to all fields:

\TU	Tool tip (PDF 1.3), for example, \TU{Address}. Obeys unicode option.	\TU{}
\Ff	See the Field flag Ff table ; e.g. \Ff{\FfReadOnly} makes the field read only.	\Ff{}
\DV	Default value of a field. This is the value that appears when the field is reset; e.g., \DV{Name:}. Obeys unicode option.	\DV{}
\V	Current value of the field; for example, \V{D. P. Story}. Obeys unicode option.	\V{}

Entries specific to a widget annotation:

\H	Highlight, used in button fields and link annotations. Possible values are N (None), P (Push), O (Outline), I (Invert); e.g., \H{P}.	\H{ (same as \H{I})
----	--	------------------------

Appearance Characteristics Dictionary (MK)

\MK	A dictionary that contains the keys listed below. For all fields the MK has a template that is filled in using the keys below; this key is available only for check boxes and radio buttons.	various
\R	Number of degrees the field is to be rotated counterclockwise. Must be a multiple of 90 degrees; \R{90}.	\R{}
\BC	The boundary color, a list of 0 (transparent), 1 (gray), 3 (RGB) or 4 (CMYK) numbers between 0 and 1. For example, \BC{1 0 0} is a red border.	\BC{ (transparent)

Key	Description	Default
<code>\BG</code>	Background color. Color specification same as <code>\BC</code>	<code>\BG{}</code> (transparent)
<code>\CA</code>	Button fields (push, check, radio) The widget's normal caption; e.g. <code>\CA{Push}</code> , in the case of a push button. For check boxes and radio, the value of <code>\CA</code> is a code that indicates whether a check, circle, square, star, etc. is used. These codes are introduced through <code>\symbolchoice</code> . Obeys <code>unicode</code> option.	<code>\CA{}</code>
<code>\RC</code>	Push button fields only. The roll over text caption. Obeys <code>unicode</code> option.	<code>\RC{}</code>
<code>\AC</code>	Push button fields only. The down button caption. Obeys <code>unicode</code> option.	<code>\AC{}</code>
<code>\mkIns</code>	A variable for introducing into the MK dictionary any other key-value pairs not listed above. Principle examples are I, RI, IX, IF, TP, which are used for displaying icons on a button field. See an example in the demo file <code>eforms.tex</code>	<code>\mkIns{}</code>
<code>\I</code>	(push buttons only) an indirect reference to a form <code>XObject</code> defining the buttons's <i>normal icon</i>	<code>\I{nIcon}</code> (example)
<code>\RI</code>	(push buttons only) an indirect reference to a form <code>XObject</code> defining the buttons's <i>rollover icon</i>	<code>\RI{rIcon}</code> (example)
<code>\IX</code>	(push buttons only) an indirect reference to a form <code>XObject</code> defining the buttons's <i>down icon</i>	<code>\I{dIcon}</code> (example)
<code>\importIcons</code>	(push buttons only) a special key to signal that this button is the target of JavaScript that will supply the icons faces. Syntax: <code>\importIcons{y n}</code>	<code>\importIcons{n}</code>

Key	Description	Default
	<code>\TP{<0 1 2 3 4 5 6>}</code> (push buttons only; optional) A code indicating the layout of the text and icon; these codes are 0 (label only); 1 (icon only); 2 (label below icon); 3 (label above icon); 4 (label to the right of icon); 5 (label to the left of icon); 6 (label overlaid on the icon). The default is 0.	<code>\TP{0}</code>
	<code>\SW{<A B S N>}</code> (push buttons only; optional) The <i>scale when key</i> . Permissible values are A (always scale), B (scale when icon is too big), S (scale when icon is too small), N (never scale). The default is A.	<code>\SW{A}</code>
	<code>\ST{<A P>}</code> (push buttons only; optional) The <i>scaling type</i> . Permissible values are A (anamorphic scaling); P (proportional scaling). The default is P.	<code>\ST{P}</code>
	<code>\PA{<num₁ num_{2 (push buttons only; optional) The <i>position array</i>. An array of two numbers, each between 0 and 1 indicating the fraction of left-over space to allocate at the left and bottom of the annotation rectangle. The two numbers should be separated by a space. The default value, <code>\PA{.5 .5}</code>, centers the icon in the rectangle.}</code>	<code>\PA{.5 .5}</code>
	<code>\FB{true false}</code> (push buttons only; optional) The <i>fit bounds</i> Boolean. If <code>true</code> , the button appearance is scaled to fit fully within the bounds of the annotation without taking into consideration the line width of the border.	<code>\FB{false}</code>

Entries common to fields containing variable text:

<code>\Q{0 1 2 empty}</code> Quadding for text fields. Values are 0 (left-justified), 1 (centered), 2 (right-justified); e.g., <code>\Q{1}</code> .	<code>Q{}</code> (left justified)
---	--------------------------------------

Key	Description	Default
Default Appearance (DA)		
	<code>\DA</code> Default appearance string of the text in the widget. Normally, you just specify text font, size and color. Can be redefined, advance techniques needed.	
<code>\textFont{<font-spec>}</code>	Font to be used to display the text	<code>\textFont{Helv}</code>
<code>\textSize{<num>}</code>	The size in points of the text	<code>\textSize{9}</code>
<code>\textColor{<color-spec>}</code>	The color of the text. There are several color spaces, including grayscale and RGB; for example, <code>\textColor{1 0 0 rg}</code> , gives a red font. Recent advances in parsing this command have eliminated the need to include the color space specification. Thus, <code>\textColor{1 0 0}</code> also gives a red font.	<code>\textColor{0 g}</code>

Entries specific to text fields:

`\MaxLen{<num|empty>}` The maximum length of the text string input into a text field. Used also with comb fields to set the number of combs. Example, `\MaxLen{15}`.

Entries specific to signature fields:

`\Lock` This key is used to lock fields after the signature field is signed. Example, `\Lock{/Actions/All}`. See [subsection 2.4](#), page 15 for more examples.

Entries that change the width and height of a field:

`\rectW{<length>}` Set the width of a field to `<length>`, the height is not changed `\rectW{}`

`\rectH{<length>}` Set the height of a field to `<length>`, the width is not changed `\rectH{}`

Key	Description	Default
<code>\width{⟨length⟩}</code>	Set the width to <i>⟨length⟩</i> and re-scale the height to keep the same aspect ratio	<code>\width{}</code>
<code>\height{⟨length⟩}</code>	Set the height to <i>⟨length⟩</i> and re-scale the width to keep the same aspect ratio	<code>\height{}</code>
<code>\scalefactor{pos-num}</code>	Re-scales both the width and height by a scale factor of <i>⟨pos-num⟩</i>	<code>\scalefactor{}</code>

Specialized, non-PDF Spec commands:

<code>\rawPDF{⟨PDF-KVPs⟩}</code>	If all else fails, you can always introduce key-value pairs through this variable.	<code>\rawPDF{}</code>
<code>\autoCenter{y n}</code>	There is a centering code that attempts to give a pleasant placement of the field. <code>\autoCenter{n}</code> turn auto centering off.	
<code>\inline{y n}</code>	If <code>\inline{y}</code> , an alternate method is used get a better vertical positioning. Designed for inline form fields. The default is <code>\inline{n}</code> .	
<code>\presets{⟨cmd⟩}</code>	This commands takes a macro as its argument, the text of the macro are key-value pairs. This is useful for setting up a series of presets for fields. Example, <code>\presets{\myFavFive}</code>	
<code>\symbolchoice{⟨symbol-choice⟩}</code>	Use this variable to specify what symbol is to be used with a check box or radio button. Possible values are <code>check</code> , <code>circle</code> , <code>cross</code> , <code>diamond</code> , <code>square</code> and <code>star</code> . Can be used to globally change the symbol choice as well; for example, <code>\symbolchoice{check}</code> , which is the default value.	
<code>\cmd{⟨cmd-args⟩}</code>	Passes its argument into the key-value parsing stream, refer to page 56 for an example.	

Key	Description	Default
<code>\linktxtcolor{<named-color empty>}</code>	The value of this variable is a named color and is the color of the link text. Only recognized in link annotations. A value of <code>\linktxtcolor{}</code> paints the text the <code>\normalcolor</code> .	<code>\linktxtcolor{@linkcolor}</code>

Special link key-values used by `aeb_mlink` and `annot_pro`

<code>\mlstrut{<strut>}</code>	Adjusts the height of a multi-line link, e.g., <code>\mlstrut{\large\strut}</code>	<code>\mlstrut{\strut}</code>
<code>\mlcrackat{<num empty>}</code>	Used to break a multi-line link across a page boundary; specifying <code>\mlcrackat{3}</code> breaks the link after the 3rd syllable. The <code>aeb_mlink</code> package then creates two links consisting of the text up to and including the crack-at value and the second link consisting of the rest of the hypertext link (or url) string.	<code>\mlcrackat{}</code>
<code>\mlhyph{y n}</code>	A key that takes ‘y’ or ‘n’ as its value. If ‘y’ is passed, then a hyphen is inserted after the break in a multi-line link that crosses a page boundary.	<code>\mlhyph{n}</code>
<code>\mlignore{0 1}</code>	An internal switch used in building multi-line links and text markup annotations that cross page boundaries. <i>Do not use.</i>	<code>\mlignore{0}</code>
<code>\mlcrackinsat{<latex-content>}</code>	This key inserts its argument after the hyphen (if there is one) at the point declared by the <code>\crackat</code> value.	<code>\mlcrackinsat{}</code>
